# Capacity utilization rates in Canadian manufacturing

First quarter 1983

# Taux d'utilisation de la capacité dans les industries manufacturières au Canada

Premier trimestre 1983

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 9Z9 (Telephone: 995-8152) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831
Ontario	1-800-268-1151
Manitoba	1-800-282-8006
Saskatchewan	1(112)800-667-3524
Alberta	1-800-222-6400
British Columbia (South and Central)	112-800-663-1551
Yukon and Northern B.C. (area served by NorthwTel Inc.)	Zenith 0-8913
Northwest Territories (area served by NorthwTel Inc.)	Zenith 2-2015

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0V7.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolinguage et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et du stock de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 9Z9 (téléphone: 995-8152) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

Terre-Neuve et Labrador	Zénith 0-7037
Nouvelle-Écosse, Nouveau-Brunswick et Île-du-Prince-Édouard	1-800-565-7192

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

.. figures not available.

... figures not appropriate or not applicable.

- nil or zero.

-- amount too small to be expressed.

P preliminary figures.

R revised figures.

x confidential to meet secrecy requirements of the Statistics Act.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

.. nombres indisponibles.

... n'ayant pas lieu de figurer.

- néant ou zéro.

-- nombres infimes.

P nombres provisoires.

R nombres rectifiés.

x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

## INTRODUCTION

From the point of view of utilization of resources available for the production of goods, there is a significant similarity between the labour force and the stock of capital in place. Any degree of under-utilization in either type of resource indicates the gap between potential and actual use of these resources. However, when the socio-political implications of unemployed resources are considered, then the difference between capital stocks and labour becomes substantial.

It is common knowledge that the stock of capital in place typically is not used with the same degree of intensity over the year. Recently, increasing attention has been focused on the measurement of productive potential and the extent to which it is realized. This capacity utilization measurement is an interesting way of examining the relationship between the total resources available and the level of potential output. Within this context, utilization measures could establish significant yardsticks indicative of trends and cycles in capacity utilization.

Economists, particularly in the United States, in their efforts to measure capacity have developed a number of alternative methods varying from direct annual surveys to econometric models.

At present in Canada, the Department of Industry, Trade and Commerce produces an index of capacity utilization for the goods-producing industries by using the Wharton School trend-through-peak estimation procedures.<sup>(1)</sup> This index is derived from seasonally adjusted quarterly indexes of industrial production, which are charted and the peaks selected by inspection. These peaks are considered to be the capacity output of the industry. Successive capacity peaks are joined by a straight line to indicate the capacity during the intervening periods. Forward extrapolation of the same straight line generates capacity measures for periods following the last peak until the actual production index intersects the line.

Si l'on se place dans la perspective de l'utilisation des ressources disponibles, on constate une certaine similitude entre la main-d'oeuvre occupée et le stock de capital en place. Tout degré de sous-utilisation de l'une ou l'autre de ces ressources indique qu'il existe une différence entre leur utilisation potentielle et réelle. Cependant, si l'on tient compte des implications sociales et politiques de la non-utilisation des ressources disponibles, la différence entre les stocks de capital et la main-d'oeuvre s'accroît.

Il est reconnu que le stock de capital en place n'est pas utilisé dans la même proportion d'une année à l'autre. Depuis quelque temps, on cherche de plus en plus à mesurer d'une façon précise la différence entre le potentiel de productivité et la productivité réelle. Cette mesure de l'utilisation de la capacité peut servir à examiner la relation existant entre l'ensemble des ressources disponibles et le potentiel de production. De plus, une mesure de l'utilisation de la capacité pourrait servir à mesurer les tendances et les cycles à l'intérieur de celle-ci.

Dans le cadre de travaux sur la mesure de la capacité, des économistes, en particulier aux États-Unis, ont mis sur pied un certain nombre d'autres méthodes de quantification allant des enquêtes annuelles directes aux modèles économétriques.

Au Canada, le ministère de l'Industrie et du Commerce produit actuellement un indice de l'utilisation de la capacité pour les industries de biens d'après les méthodes d'estimation de la tendance générale par les sommets de l'école Wharton<sup>(1)</sup>. Cet indice est calculé à partir d'indices trimestriels désaisonnalisés de la production industrielle, qui sont reportés sur un graphique sur lequel on choisit les sommets. On considère que ces sommets représentent la capacité de production de l'industrie. Les différents sommets atteints au cours de chaque trimestre sont reliés par une ligne droite de façon à indiquer la capacité au cours de la période comprise entre deux sommets. Une extrapolation directe de cette même ligne droite permet de mesurer la capacité pour la période comprise entre le dernier sommet jusqu'à l'intersection par l'indice de la production réelle de la ligne droite.

(1) These indexes are published in **Rate of Capacity Utilization, Canada**. Department of Industry, Trade and Commerce, Ottawa.

(1) Ces indices sont publiés dans **Taux d'utilisation de la capacité**. Ministère de l'Industrie et du Commerce, Ottawa.

The Statistics Canada approach represents an alternative measure and is based on the capital-output ratio of each industry. It provides a basis for establishing the capacity output series with which actual output data are compared in order to derive the utilization rates. The definition of capacity in this procedure is the maximum output obtainable under "normal" technological and market conditions.

Some differences in level exist between the Statistics Canada series and those of the Department of Industry, Trade and Commerce. This situation is to be expected, of course, given the different estimation procedures underlying each set of measures.

The Statistical Tables show quarterly indexes of capacity utilization in Canadian manufacturing broken down into various major groups according to the 1970 **Standard Industrial Classification**.

The methodology used to produce these indexes is based on a comparison of the **actual** output of an industry during a certain time period with the estimated **capacity** output during that period.(2)

The estimated capacity output is based on a capacity capital-output ratio derived from the industry's gross stock of fixed capital, measured in 1971 dollars. These capital stock estimates are produced by the National Wealth and Capital Stock Section of Statistics Canada, and a brief outline of the method used to derive the estimates follows.(3)

The measurement procedure underlying the capital stock estimates is known as the "perpetual inventory" method. Briefly, this method involves the accumulation, over a period of years, of investment expenditures by industry to obtain its capital stock in any given year. The basic ingredients required are:

Annual investment series in current dollars by industry and category of expenditure;

price deflators relating to the investment-series; and

estimates of the average economic life of the assets used in the various industries.

(2) The concepts of capacity used follows the work of Daniel Creamer, "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, No. 72 National Industrial Conference Board, New York, 1961.

(3) Capital stock estimates are published in **Fixed Capital Flows and Stocks**, Catalogue 13-211, Annual.

L'approche de Statistique Canada est en fait un autre genre de mesure et repose sur le coefficient de capital de chaque industrie. Elle permet d'établir des séries sur la capacité de production que l'on compare aux données sur la production réelle de façon à obtenir les taux d'utilisation. La capacité, d'après cette méthode, se définit comme le maximum de biens que l'on peut produire dans des conditions technologiques et commerciales "normales".

Il existe certaines différences de niveau entre les séries de Statistique Canada et celles du ministère de l'Industrie et du Commerce. Il va sans dire que ces différences proviennent du fait que les méthodes d'estimation de chacun des ensembles de mesures sont différentes.

Les tableaux statistiques présentent des indices trimestriels de l'utilisation de la capacité pour les industries manufacturières du Canada ventilés en principaux groupes selon la **Classification des activités économiques**, de 1970.

La méthodologie inhérente au calcul de ces indices repose sur la comparaison de la production **réelle** d'une industrie au cours d'une certaine période avec la **capacité** estimée de production au cours de cette même période(2).

La capacité de production estimée est calculée d'après le coefficient de capital de capacité obtenu à partir du stock brut de capital fixe de l'industrie, mesuré en dollars de 1971. Ces estimations du stock de capital sont produites par la Section de la richesse nationale et du stock de capital de Statistique Canada. Voici une brève description de la méthode utilisée pour calculer les estimations(3).

La méthode de mesure des estimations de stocks de capital est celle de "l'inventaire perpétuel". En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissement de l'industrie pour obtenir son stock de capital pour une année donnée. Les éléments fondamentaux nécessaires sont:

Les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les différentes industries.

(2) La définition de la capacité utilisée ici est celle qu'a formulée Daniel Creamer dans "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, n° 72, National Industrial Conference Board, New York, 1961.

(3) Des estimations du stock de capital sont publiées dans **Flux et stocks de capital fixe**, n° 13-211 au catalogue, annuel.

To illustrate the mechanics of the "perpetual inventory" method, an example of the actual computing process is given. (Text Table I summarizes the computational procedure involved in this example.) Assume that the capital assets in a particular industry remain in production for 10 years before they are retired. We start with year one and adjusting for prices, we accumulate the investment expenditures pertaining to the types of capital assets in question for a period of 10 years. In the tenth year, a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year, we deduct from the accumulated total the investment expenditures of the first year and add the purchase of capital assets of the eleventh year. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimated. The net stock is equal to the difference between the cumulative value of past gross investment and cumulative depreciation.

The quarterly capital estimates are derived by applying a linear interpolation to the annual capital stocks. The stock estimates are adjusted for pollution abatement expenditures and then combined with the seasonally adjusted quarterly production indexes to derive quarterly capital-output ratios for the whole period. The production indexes for the Petroleum and Coal Industry are the gross output rather than the gross domestic product which are used for all other industries. It is felt that the gross output index better reflects the performance of the industry in the light of significant price changes.(4)

(4) The indexes of industrial production used are those published in **Gross Domestic Product by Industry**, Catalogues 61-213, and 61-005, Statistics Canada.

Pour expliquer le mécanisme de "l'inventaire perpétuel", voici un exemple du processus réel du calcul. (Le tableau explicatif I résume le processus du calcul.) Supposons que l'actif immobilisé de l'industrie demeure en production pendant 10 ans avant d'être retiré. On commence par la première année et, après déflation, on accumule les dépenses d'investissement se rapportant aux catégories de capital considérées pour une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs immobilisés de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif et on ajoute les achats d'actifs immobilisés au cours de la onzième année. On procède de la même façon pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs immobilisés à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Le stock net est égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée.

Les estimations trimestrielles de capital sont calculées d'après une interpolation linéaire des stocks annuels de capital. Ces estimations de stocks sont ajustées pour tenir compte des dépenses engagées au titre de la réduction de la pollution et ensuite combinées aux indices trimestriels désaisonnalisés de la production pour donner les coefficients de capital trimestriels pour l'ensemble de la période. L'indice de la production pour l'industrie des dérivés du pétrole et du charbon est l'indice de la production brute au lieu de celui du produit intérieur brut qui est utilisé dans les autres industries. En vue d'importants changements des prix, on croit que l'indice de la production brute soit plus représentatif de la performance de cette industrie(4).

(4) Les indices de la production industrielle utilisés ont été publiés dans **Produit intérieur brut par industrie**, n° 61-213 et 61-005 au catalogue, Statistique Canada.

These ratios are expressed in the Statistical Tables in constant 1971 dollars in order to show the degree of capital intensity in the various industries. The minimum capital-output ratio during this period indicates the historical capacity peak. When we divide the capital stocks series by the minimum capital-output ratio, we obtain a series of potential output.

As the final step in this procedure, actual data for individual production indexes are expressed as a ratio of the potential output series in percentage form to obtain the indexes of capacity utilization.

We summarize the procedure of measuring the capacity and operating rates in the following fashion:

Let  $K_t$  = fixed capital stocks at time  $t$ ,

let  $\frac{K_0}{P_0}$  = capacity capital-output ration

where  $K_0$  = fixed capital in benchmark period(5)

and  $P_0$  = capacity output in the same period,

let  $P_t$  = actual output at time  $t$ ,

and  $CP_t$  = estimated capacity output at time  $t$ .

Then  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = percentage of capacity utilized at time  $t$ ; that is, the capacity utilization rate.

Of course, in subsequent periods, if a lower capital-output ratio occurs, it is adopted as the capacity ratio, and the entire series is adjusted accordingly.

This formula was used to calculate the manufacturing industry capacity utilization rates shown in the Statistical Tables. The indexes for durable, non-durable and total

Dans les Tableaux statistiques, ces coefficients sont exprimés en dollars constants de 1971 de façon à indiquer le degré d'intensité de capital des différentes industries. Le coefficient de capital minimum au cours de cette période indique le sommet historique de la capacité. Lorsqu'on divise les séries des stocks de capital par le coefficient de capital minimum, on obtient une série de la production potentielle.

Enfin, les données réelles pour les indices de production individuels sont exprimées en tant que ratio des séries de la production potentielle en pourcentage pour obtenir les indices de l'utilisation de la capacité.

Nous pouvons résumer ainsi la marche à suivre pour la mesure des taux d'utilisation de la capacité et d'activité:

Soit  $K_t$  = stocks de capital au temps  $t$ ,

et soit  $\frac{K_0}{P_0}$  = coefficient de capital de la capacité

où  $K_0$  = capital fixe au cours de la période repère(5)

et  $P_0$  = production potentielle au cours de la même période,

soit  $P_t$  = production réelle au temps  $t$ ,

et  $CP_t$  = production potentielle prévue au temps  $t$ .

Alors  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = pourcentage de la capacité utilisée au temps  $t$ ; c'est-à-dire le taux d'utilisation de la capacité.

Bien entendu, lorsque l'on enregistre un coefficient de capital plus bas, au cours des périodes qui suivent, on le considère comme étant le ratio de capacité, et toute la série est ajustée en conséquence.

Cette formule a été utilisée pour calculer les taux de l'utilisation de la capacité des industries manufacturières présentés dans les Tableaux statistiques. Les indices ont été calculés par

(5) As noted previously, this benchmark period is the time when the minimum capital-output ratio occurred.

(5) Comme il a été mentionné auparavant, cette période repère est le moment où l'on a enregistré le plus bas coefficient capital-production.

manufacturing were derived by aggregation, using the same weights as the 1971 Gross Domestic Product.(6)

The statistics presented here are only statistical estimates and they are not operating ratios based on either engineering measures, such as productive machine hours, or survey results.

(6) For the period prior to 1971 the data are not available on a 1971 base. To obtain a continuous record on a 1971 base, the indexes on a 1961 base were mechanically rebased to 1971 by multiplying by 100.0 and dividing by the 1971 index value on a 1961 base. An adjustment has been made to the production indexes for Rubber and Plastics Products, and Miscellaneous Manufacturing, based on the annual Real Domestic Product Indexes, to capture the trend of the individual industries according to the 1970 Standard Industrial Classification, from 1961 to 1970.

agrégation tant pour l'ensemble des industries manufacturières que pour les industries des biens durables et non durables à partir des mêmes pondérations que celles pour du produit intérieur brut de 1971(6).

Ces chiffres représentent uniquement des approximations et ne sont pas des coefficients de fonctionnement basés sur des mesures industrielles, comme les heures de production des machines, ni des résultats d'une enquête.

(6) En ce qui concerne les années antérieures à 1971, les données ne sont pas disponibles sur la base 1971 = 100. Pour obtenir une continuité des données de ces années, les indices sur la base 1961 = 100 furent convertis arithmétiquement à l'année de référence 1971 en les multipliant par 100.0 et en divisant le produit obtenu par la valeur de l'indice de 1971 sur la base de 1961 = 100. On a ajusté les indices de production de l'industrie du caoutchouc et des produits en matière plastique, et des industries manufacturières diverses, basés sur l'indice annuel du produit intérieur réel de façon à connaître la tendance des industries selon la Classification des activités économiques de 1970, pour la période de 1961 à 1970.

Given the many conceptual and measurement problems surrounding the notion of capacity utilization, the utilization rates shown here are indicative of trends and cycles in the utilization of capital. The indicated level is only a statistical approximation and should be viewed as such. For example, a rate of 100% indicates a high level of capital utilization which is considered a peak for the period observed.

Étant donné qu'il existe plusieurs problèmes relatifs à la notion du taux d'utilisation, il conviendrait de noter que les taux d'utilisation publiés ne constituent pas des mesures exactes, mais des statistiques indiquant les tendances et les cycles d'utilisation du stock de capital fixe. Par exemple, un taux de 100% indique un haut niveau de l'utilisation de capital qui est considéré un sommet pendant la période observée.

## TEXT TABLE II. CANSIM Databank Numbers

### TABEAU EXPLICATIF II. Numéros dans la banque de données CANSIM

CANSIM Matrix Number 3539: Capacity Utilization Rates in Canadian Manufacturing

Numéro de matrice CANSIM 3539: Taux d'utilisation de la capacité dans les industries manufacturières au Canada

Industry	Databank number
Industrie	Numéro dans la banque de données
Food and beverages - Aliments et boissons	D883568
Tobacco products - Tabacs	D883569
Rubber and plastics products industries - Industrie du caoutchouc et des produits en matière plastique	D883570
Leather - Cuir	D883571
Textile - Textiles	D883572
Knitting mills - Bonneterie	D883573
Clothing - Vêtements	D883574
Wood - Bois	D883575
Furniture and fixtures - Meubles et accessoires	D883576
Paper and allied industries - Papiers et industries connexes	D883577
Printing, publishing and allied industries - Impression, publication et industries connexes	D883578
Primary metals - Métaux primaires	D883579
Metal fabricating - Fabrications métalliques	D883580
Machinery - Machines	D883581
Transportation equipment - Matériel de transport	D883582
Electrical products - Appareils et fournitures électriques	D883583
Non-metallic mineral products - Produits des minéraux non-métalliques	D883584
Petroleum and coal products - Dérivés du pétrole et du charbon	D883585
Chemical and chemical products - Produits chimiques	D883586
Miscellaneous manufacturing - Industries diverses	D883587
Durable manufacturing industries - Industries manufacturières de biens durables	D883588
Non-durable manufacturing industries - Industries manufacturières de biens non-durables	D883589
Total manufacturing industries - Ensemble du secteur manufacturier	D883590

TEXT TABLE III. Composition of Aggregates, and Gross Domestic Product Weights

TABLEAU EXPLICATIF III. Composition des agrégations, et les pondérations du produit intérieur brut.

Aggregate	Component industries	1971 gross domestic product weight	
Agrégation	Industries composantes	Pondération du produit intérieur brut de 1971	
		Percentage	Millions of dollars
		Pourcentage	Millions de dollars
Durable manufacturing industries - Industries manufacturières de biens durables	Wood - Bois	0.998	831.2
	Furniture and fixtures - Meubles et accessoires	0.420	349.6
	Primary metals - Métaux primaires	1.990	1,657.0
	Metal fabricating - Fabrications métalliques	1.971	1,640.7
	Machinery - Machines	1.004	836.1
	Transportation equipment - Matériel de transport	2.700	2,248.1
	Electrical products - Appareils et fournitures électriques	1.605	1,336.5
	Non-metallic mineral products - Produits des minéraux non métalliques	0.896	745.7
Non-durable manufacturing industries - Industries manufacturières de biens non durables	Food and beverages - Aliments et boissons	3.171	2,640.3
	Tobacco products - Tabacs	0.217	180.3
	Rubber and plastics products industries - Industrie du caoutchouc et des produits en matière plastique	0.648	539.4
	Leather - Cuir	0.209	174.4
	Textile - Textiles	0.788	655.9
	Knitting mills - Bonneterie	0.214	178.1
	Clothing - Vêtements	0.726	604.3
	Paper and allied industries - Papiers et industries connexes	1.881	1,566.4
	Printing, publishing and allied industries - Impression, publication et industries connexes	1.104	918.9
	Petroleum and coal products - Dérivés du pétrole et du charbon	0.315	262.5
	Chemical and chemical products - Produits chimiques	1.359	1,131.2
	Miscellaneous manufacturing - Industries diverses	0.654	544.4

## LIST OF RELATED PUBLICATIONS

### Catalogue

#### Occasional

- 13-522 Fixed Capital Flows and Stocks, Manufacturing, Canada, 1926-1960. Methodology, 1967. English.
- 13-568 Fixed Capital Flows and Stocks, Historical. Bilingual.

#### Annual

- 13-211 Fixed Capital Flows and Stocks. Bilingual.
- 61-205 Private and Public Investment in Canada, Outlook. Bilingual.
- 61-206 Private and Public Investment in Canada, Mid-year Review. Bilingual.
- 61-213 Gross Domestic Product by Industry. Bilingual.

#### Monthly

- 61-005 Gross Domestic Product by Industry. Bilingual.

In addition to the selected publications listed above, Statistics Canada publishes a wide range of statistical reports on Canadian economic and social affairs. A comprehensive catalogue of all current publications is available free on request from Statistics Canada, Ottawa, K1A 0T6.

## LISTE DES PUBLICATIONS CONNEXES

### Catalogue

#### Hors Série

- 13-522 Fixed Capital Flows and Stocks, Manufacturing, Canada, 1926-1960 Methodology, 1967. Anglais.
- 13-568 Flux et stocks de capital fixe, historique. Bilingue.

#### Annuel

- 13-211 Flux et stocks de capital fixe. Bilingue.
- 61-205 Investissements privés et publics au Canada, Perspectives. Bilingue.
- 61-206 Investissements privés et publics au Canada, Revue de la mi-année. Bilingue.
- 61-213 Produit intérieur brut par industrie. Bilingue.

#### Mensuel

- 61-005 Produit intérieur brut par industries. Bilingue.

Outre les publications ci-dessus énumérées, Statistique Canada publie une grande variété de rapports statistiques sur le Canada tant dans le domaine économique que social. On peut se procurer gratuitement un catalogue complet des publications courantes à Statistique Canada, Ottawa, K1A 0T6.

Second quarter 1983

# Taux d'utilisation de la capacité dans les industries manufacturières au Canada

Deuxième trimestre 1983

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 9Z9 (Telephone: 995-8152) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0V7.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordinolingué et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et du stock de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 9Z9 (téléphone: 995-8152) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- † revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- .. nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- P nombres provisoires.
- † nombres rectifiés.
- x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

## INTRODUCTION

From the point of view of utilization of resources available for the production of goods, there is a significant similarity between the labour force and the stock of capital in place. Any degree of under-utilization in either type of resource indicates the gap between potential and actual use of these resources. However, when the socio-political implications of unemployed resources are considered, then the difference between capital stocks and labour becomes substantial.

It is common knowledge that the stock of capital in place typically is not used with the same degree of intensity over the year. Recently, increasing attention has been focused on the measurement of productive potential and the extent to which it is realized. This capacity utilization measurement is an interesting way of examining the relationship between the total resources available and the level of potential output. Within this context, utilization measures could establish significant yardsticks indicative of trends and cycles in capacity utilization.

Economists, particularly in the United States, in their efforts to measure capacity have developed a number of alternative methods varying from direct annual surveys to econometric models.

At present in Canada, the Department of Industry, Trade and Commerce produces an index of capacity utilization for the goods-producing industries by using the Wharton School trend-through-peak estimation procedures.<sup>(1)</sup> This index is derived from seasonally adjusted quarterly indexes of industrial production, which are charted and the peaks selected by inspection. These peaks are considered to be the capacity output of the industry. Successive capacity peaks are joined by a straight line to indicate the capacity during the intervening periods. Forward extrapolation of the same straight line generates capacity measures for periods following the last peak until the actual production index intersects the line.

Si l'on se place dans la perspective de l'utilisation des ressources disponibles, on constate une certaine similitude entre la main-d'oeuvre occupée et le stock de capital en place. Tout degré de sous-utilisation de l'une ou l'autre de ces ressources indique qu'il existe une différence entre leur utilisation potentielle et réelle. Cependant, si l'on tient compte des implications sociales et politiques de la non-utilisation des ressources disponibles, la différence entre les stocks de capital et la main-d'oeuvre s'accroît.

Il est reconnu que le stock de capital en place n'est pas utilisé dans la même proportion d'une année à l'autre. Depuis quelque temps, on cherche de plus en plus à mesurer d'une façon précise la différence entre le potentiel de productivité et la productivité réelle. Cette mesure de l'utilisation de la capacité peut servir à examiner la relation existant entre l'ensemble des ressources disponibles et le potentiel de production. De plus, une mesure de l'utilisation de la capacité pourrait servir à mesurer les tendances et les cycles à l'intérieur de celle-ci.

Dans le cadre de travaux sur la mesure de la capacité, des économistes, en particulier aux États-Unis, ont mis sur pied un certain nombre d'autres méthodes de quantification allant des enquêtes annuelles directes aux modèles économétriques.

Au Canada, le ministère de l'Industrie et du Commerce produit actuellement un indice de l'utilisation de la capacité pour les industries de biens d'après les méthodes d'estimation de la tendance générale par les sommets de l'école Wharton<sup>(1)</sup>. Cet indice est calculé à partir d'indices trimestriels désaisonnalisés de la production industrielle, qui sont reportés sur un graphique sur lequel on choisit les sommets. On considère que ces sommets représentent la capacité de production de l'industrie. Les différents sommets atteints au cours de chaque trimestre sont reliés par une ligne droite de façon à indiquer la capacité au cours de la période comprise entre deux sommets. Une extrapolation directe de cette même ligne droite permet de mesurer la capacité pour la période comprise entre le dernier sommet jusqu'à l'intersection par l'indice de la production réelle de la ligne droite.

(1) These indexes are published in **Rate of Capacity Utilization, Canada**. Department of Industry, Trade and Commerce, Ottawa.

(1) Ces indices sont publiés dans **Taux d'utilisation de la capacité**. Ministère de l'Industrie et du Commerce, Ottawa.

The Statistics Canada approach represents an alternative measure and is based on the capital-output ratio of each industry. It provides a basis for establishing the capacity output series with which actual output data are compared in order to derive the utilization rates. The definition of capacity in this procedure is the maximum output obtainable under "normal" technological and market conditions.

Some differences in level exist between the Statistics Canada series and those of the Department of Industry, Trade and Commerce. This situation is to be expected, of course, given the different estimation procedures underlying each set of measures.

The Statistical Tables show quarterly indexes of capacity utilization in Canadian manufacturing broken down into various major groups according to the 1970 **Standard Industrial Classification**.

The methodology used to produce these indexes is based on a comparison of the actual output of an industry during a certain time period with the estimated capacity output during that period.(2)

The estimated capacity output is based on a capacity capital-output ratio derived from the industry's gross stock of fixed capital, measured in 1971 dollars. These capital stock estimates are produced by the National Wealth and Capital Stock Section of Statistics Canada, and a brief outline of the method used to derive the estimates follows.(3)

The measurement procedure underlying the capital stock estimates is known as the "perpetual inventory" method. Briefly, this method involves the accumulation, over a period of years, of investment expenditures by industry to obtain its capital stock in any given year. The basic ingredients required are:

Annual investment series in current dollars by industry and category of expenditure;

price deflators relating to the investment-series; and

estimates of the average economic life of the assets used in the various industries.

(2) The concepts of capacity used follows the work of Daniel Creamer, "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, No. 72 National Industrial Conference Board, New York, 1961.

(3) Capital stock estimates are published in **Fixed Capital Flows and Stocks**, Catalogue 13-211, Annual.

L'approche de Statistique Canada est en fait un autre genre de mesure et repose sur le coefficient de capital de chaque industrie. Elle permet d'établir des séries sur la capacité de production que l'on compare aux données sur la production réelle de façon à obtenir les taux d'utilisation. La capacité, d'après cette méthode, se définit comme le maximum de biens que l'on peut produire dans des conditions technologiques et commerciales "normales".

Il existe certaines différences de niveau entre les séries de Statistique Canada et celles du ministère de l'Industrie et du Commerce. Il va sans dire que ces différences proviennent du fait que les méthodes d'estimation de chacun des ensembles de mesures sont différentes.

Les tableaux statistiques présentent des indices trimestriels de l'utilisation de la capacité pour les industries manufacturières du Canada ventilés en principaux groupes selon la **Classification des activités économiques**, de 1970.

La méthodologie inhérente au calcul de ces indices repose sur la comparaison de la production réelle d'une industrie au cours d'une certaine période avec la capacité estimée de production au cours de cette même période(2).

La capacité de production estimée est calculée d'après le coefficient de capital de capacité obtenu à partir du stock brut de capital fixe de l'industrie, mesuré en dollars de 1971. Ces estimations du stock de capital sont produites par la Section de la richesse nationale et du stock de capital de Statistique Canada. Voici une brève description de la méthode utilisée pour calculer les estimations(3).

La méthode de mesure des estimations de stocks de capital est celle de "l'inventaire perpétuel". En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissement de l'industrie pour obtenir son stock de capital pour une année donnée. Les éléments fondamentaux nécessaires sont:

Les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les différentes industries.

(2) La définition de la capacité utilisée ici est celle qu'a formulée Daniel Creamer dans "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, n° 72, National Industrial Conference Board, New York, 1961.

(3) Des estimations du stock de capital sont publiées dans **Flux et stocks de capital fixe**, n° 13-211 au catalogue, annuel.

To illustrate the mechanics of the "perpetual inventory" method, an example of the actual computing process is given. (Text Table I summarizes the computational procedure involved in this example.) Assume that the capital assets in a particular industry remain in production for 10 years before they are retired. We start with year one and adjusting for prices, we accumulate the investment expenditures pertaining to the types of capital assets in question for a period of 10 years. In the tenth year, a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year, we deduct from the accumulated total the investment expenditures of the first year and add the purchase of capital assets of the eleventh year. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimated. The net stock is equal to the difference between the cumulative value of past gross investment and cumulative depreciation.

The quarterly capital estimates are derived by applying a linear interpolation to the annual capital stocks. The stock estimates are adjusted for pollution abatement expenditures and then combined with the seasonally adjusted quarterly production indexes to derive quarterly capital-output ratios for the whole period. The production indexes for the Petroleum and Coal Industry are the gross output rather than the gross domestic product which are used for all other industries. It is felt that the gross output index better reflects the performance of the industry in the light of significant price changes.(4)

(4) The indexes of industrial production used are those published in **Gross Domestic Product by Industry**, Catalogues 61-213, and 61-005, Statistics Canada.

Pour expliquer le mécanisme de "l'inventaire perpétuel", voici un exemple du processus réel du calcul. (Le tableau explicatif I résume le processus du calcul.) Supposons que l'actif immobilisé de l'industrie demeure en production pendant 10 ans avant d'être retiré. On commence par la première année et, après déflation, on accumule les dépenses d'investissement se rapportant aux catégories de capital considérées pour une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs immobilisés de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif et on ajoute les achats d'actifs immobilisés au cours de la onzième année. On procède de la même façon pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs immobilisés à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Le stock net est égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée.

Les estimations trimestrielles de capital sont calculées d'après une interpolation linéaire des stocks annuels de capital. Ces estimations de stocks sont ajustées pour tenir compte des dépenses engagées au titre de la réduction de la pollution et ensuite combinées aux indices trimestriels désaisonnalisés de la production pour donner les coefficients de capital trimestriels pour l'ensemble de la période. L'indice de la production pour l'industrie des dérivés du pétrole et du charbon est l'indice de la production brute au lieu de celui du produit intérieur brut qui est utilisé dans les autres industries. En vue d'importants changements des prix, on croit que l'indice de la production brute soit plus représentatif de la performance de cette industrie(4).

(4) Les indices de la production industrielle utilisés ont été publiés dans **Produit intérieur brut par industrie**, n° 61-213 et 61-005 au catalogue, Statistique Canada.

These ratios are expressed in the Statistical Tables in constant 1971 dollars in order to show the degree of capital intensity in the various industries. The minimum capital-output ratio during this period indicates the historical capacity peak. When we divide the capital stocks series by the minimum capital-output ratio, we obtain a series of potential output.

As the final step in this procedure, actual data for individual production indexes are expressed as a ratio of the potential output series in percentage form to obtain the indexes of capacity utilization.

We summarize the procedure of measuring the capacity and operating rates in the following fashion:

Let  $K_t$  = fixed capital stocks at time  $t$ ,

let  $\frac{K_0}{P_0}$  = capacity capital-output ration

where  $K_0$  = fixed capital in benchmark period(5)

and  $P_0$  = capacity output in the same period,

let  $P_t$  = actual output at time  $t$ ,

and  $CP_t$  = estimated capacity output at time  $t$ .

Then  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = percentage of capacity utilized at time  $t$ ; that is, the capacity utilization rate.

Of course, in subsequent periods, if a lower capital-output ratio occurs, it is adopted as the capacity ratio, and the entire series is adjusted accordingly.

This formula was used to calculate the manufacturing industry capacity utilization rates shown in the Statistical Tables. The indexes for durable, non-durable and total

Dans les Tableaux statistiques, ces coefficients sont exprimés en dollars constants de 1971 de façon à indiquer le degré d'intensité de capital des différentes industries. Le coefficient de capital minimum au cours de cette période indique le sommet historique de la capacité. Lorsqu'on divise les séries des stocks de capital par le coefficient de capital minimum, on obtient une série de la production potentielle.

Enfin, les données réelles pour les indices de production individuels sont exprimées en tant que ratio des séries de la production potentielle en pourcentage pour obtenir les indices de l'utilisation de la capacité.

Nous pouvons résumer ainsi la marche à suivre pour la mesure des taux d'utilisation de la capacité et d'activité:

Soit  $K_t$  = stocks de capital au temps  $t$ ,

et soit  $\frac{K_0}{P_0}$  = coefficient de capital de la capacité

où  $K_0$  = capital fixe au cours de la période repère(5)

et  $P_0$  = production potentielle au cours de la même période,

soit  $P_t$  = production réelle au temps  $t$ ,

et  $CP_t$  = production potentielle prévue au temps  $t$ .

Alors  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = pourcentage de la capacité utilisée au temps  $t$ ; c'est-à-dire le taux d'utilisation de la capacité.

Bien entendu, lorsque l'on enregistre un coefficient de capital plus bas, au cours des périodes qui suivent, on le considère comme étant le ratio de capacité, et toute la série est ajustée en conséquence.

Cette formule a été utilisée pour calculer les taux de l'utilisation de la capacité des industries manufacturières présentés dans les Tableaux statistiques. Les indices ont été calculés par

(5) As noted previously, this benchmark period is the time when the minimum capital-output ratio occurred.

(5) Comme il a été mentionné auparavant, cette période repère est le moment où l'on a enregistré le plus bas coefficient capital-production.

manufacturing were derived by aggregation, using the same weights as the 1971 Gross Domestic Product.(6)

The statistics presented here are only statistical estimates and they are not operating ratios based on either engineering measures, such as productive machine hours, or survey results.

(6) For the period prior to 1971 the data are not available on a 1971 base. To obtain a continuous record on a 1971 base, the indexes on a 1961 base were mechanically rebased to 1971 by multiplying by 100.0 and dividing by the 1971 index value on a 1961 base. An adjustment has been made to the production indexes for Rubber and Plastics Products, and Miscellaneous Manufacturing, based on the annual Real Domestic Product Indexes, to capture the trend of the individual industries according to the 1970 Standard Industrial Classification, from 1961 to 1970.

agrégation tant pour l'ensemble des industries manufacturières que pour les industries des biens durables et non durables à partir des mêmes pondérations que celles pour du produit intérieur brut de 1971(6).

Ces chiffres représentent uniquement des approximations et ne sont pas des coefficients de fonctionnement basés sur des mesures industrielles, comme les heures de production des machines, ni des résultats d'une enquête.

(6) En ce qui concerne les années antérieures à 1971, les données ne sont pas disponibles sur la base 1971 = 100. Pour obtenir une continuité des données de ces années, les indices sur la base 1961 = 100 furent convertis arithmétiquement à l'année de référence 1971 en les multipliant par 100.0 et en divisant le produit obtenu par la valeur de l'indice de 1971 sur la base de 1961 = 100. On a ajusté les indices de production de l'industrie du caoutchouc et des produits en matière plastique, et des industries manufacturières diverses, basés sur l'indice annuel du produit intérieur réel de façon à connaître la tendance des industries selon la Classification des activités économiques de 1970, pour la période de 1961 à 1970.

Given the many conceptual and measurement problems surrounding the notion of capacity utilization, the utilization rates shown here are indicative of trends and cycles in the utilization of capital. The indicated level is only a statistical approximation and should be viewed as such. For example, a rate of 100% indicates a high level of capital utilization which is considered a peak for the period observed.

Étant donné qu'il existe plusieurs problèmes relatifs à la notion du taux d'utilisation, il conviendrait de noter que les taux d'utilisation publiés ne constituent pas des mesures exactes, mais des statistiques indiquant les tendances et les cycles d'utilisation du stock de capital fixe. Par exemple, un taux de 100% indique un haut niveau de l'utilisation de capital qui est considéré un sommet pendant la période observée.

## TEXT TABLE II. CANSIM Databank Numbers

### TABLEAU EXPLICATIF II. Numéros dans la banque de données CANSIM

CANSIM Matrix Number 3539: Capacity Utilization Rates in Canadian Manufacturing

Numéro de matrice CANSIM 3539: Taux d'utilisation de la capacité dans les industries manufacturières au Canada

Industry	Databank number
Industrie	Numéro dans la banque de données
Food and beverages - Aliments et boissons	D883568
Tobacco products - Tabacs	D883569
Rubber and plastics products industries - Industrie du caoutchouc et des produits en matière plastique	D883570
Leather - Cuir	D883571
Textile - Textiles	D883572
Knitting mills - Bonneterie	D883573
Clothing - Vêtements	D883574
Wood - Bois	D883575
Furniture and fixtures - Meubles et accessoires	D883576
Paper and allied industries - Papiers et industries connexes	D883577
Printing, publishing and allied industries - Impression, publication et industries connexes	D883578
Primary metals - Métaux primaires	D883579
Metal fabricating - Fabrications métalliques	D883580
Machinery - Machines	D883581
Transportation equipment - Matériel de transport	D883582
Electrical products - Appareils et fournitures électriques	D883583
Non-metallic mineral products - Produits des minéraux non-métalliques	D883584
Petroleum and coal products - Dérivés du pétrole et du charbon	D883585
Chemical and chemical products - Produits chimiques	D883586
Miscellaneous manufacturing - Industries diverses	D883587
Durable manufacturing industries - Industries manufacturières de biens durables	D883588
Non-durable manufacturing industries - Industries manufacturières de biens non-durables	D883589
Total manufacturing industries - Ensemble du secteur manufacturier	D883590

**Note:** To order any data from CANSIM on magnetic tape or computer printouts, contact CANSIM Division, Statistics Canada, K1A 9Z9.

TEXT TABLE III. Composition of Aggregates, and Gross Domestic Product Weights

TABLEAU EXPLICATIF III. Composition des agrégations, et les pondérations du produit intérieur brut.

Aggregate	Component industries	1971 gross domestic product weight	
Agrégation	Industries composantes	Pondération du produit intérieur brut de 1971	
		Percentage	Millions of dollars
		Pourcentage	Millions de dollars
Durable manufacturing industries - Industries manufacturières de biens durables	Wood - Bois	0.998	831.2
	Furniture and fixtures - Meubles et accessoires	0.420	349.6
	Primary metals - Métaux primaires	1.990	1,657.0
	Metal fabricating - Fabrications métalliques	1.971	1,640.7
	Machinery - Machines	1.004	836.1
	Transportation equipment - Matériel de transport	2.700	2,248.1
	Electrical products - Appareils et fournitures électriques	1.605	1,336.5
	Non-metallic mineral products - Produits des minéraux non métalliques	0.896	745.7
Non-durable manufacturing industries - Industries manufacturières de biens non durables	Food and beverages - Aliments et boissons	3.171	2,640.3
	Tobacco products - Tabacs	0.217	180.3
	Rubber and plastics products industries - Industrie du caoutchouc et des produits en matière plastique	0.648	539.4
	Leather - Cuir	0.209	174.4
	Textile - Textiles	0.788	655.9
	Knitting mills - Bonneterie	0.214	178.1
	Clothing - Vêtements	0.726	604.3
	Paper and allied industries - Papiers et industries connexes	1.881	1,566.4
	Printing, publishing and allied industries - Impression, publication et industries connexes	1.104	918.9
	Petroleum and coal products - Dérivés du pétrole et du charbon	0.315	262.5
	Chemical and chemical products - Produits chimiques	1.359	1,131.2
	Miscellaneous manufacturing - Industries diverses	0.654	544.4

#### Mensuel

- 61-005 Produit intérieur brut par industries. Bilingue.

Outre les publications ci-dessus énumérées, Statistique Canada publie une grande variété de rapports statistiques sur le Canada tant dans le domaine économique que social. On peut se procurer gratuitement un catalogue complet des publications courantes à Statistique Canada, Ottawa, K1A 0T6.

# Capacity utilization rates in Canadian manufacturing

Third quarter 1983

# Taux d'utilisation de la capacité dans les industries manufacturières au Canada

Troisième trimestre 1983

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 9Z9 (Telephone: 995-8152) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831
Ontario	1-800-268-1151
Manitoba	1-800-282-8006
Saskatchewan	1(112)800-667-3524
Alberta	1-800-222-6400
British Columbia (South and Central)	112-800-663-1551
Yukon and Northern B.C. (area served by NorthwTel Inc.)	Zenith 0-8913
Northwest Territories (area served by NorthwTel Inc.)	Zenith 2-2015

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0V7.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et du stock de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 9Z9 (téléphone: 995-8152) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

Terre-Neuve et Labrador	Zénith 0-7037

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

.. figures not available.

... figures not appropriate or not applicable.

- nil or zero.

-- amount too small to be expressed.

P preliminary figures.

† revised figures.

x confidential to meet secrecy requirements of the Statistics Act.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

.. nombres indisponibles.

... n'ayant pas lieu de figurer.

- néant ou zéro.

-- nombres infimes.

P nombres provisoires.

† nombres rectifiés.

x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

## INTRODUCTION

From the point of view of utilization of resources available for the production of goods, there is a significant similarity between the labour force and the stock of capital in place. Any degree of under-utilization in either type of resource indicates the gap between potential and actual use of these resources. However, when the socio-political implications of unemployed resources are considered, then the difference between capital stocks and labour becomes substantial.

It is common knowledge that the stock of capital in place typically is not used with the same degree of intensity over the year. Recently, increasing attention has been focused on the measurement of productive potential and the extent to which it is realized. This capacity utilization measurement is an interesting way of examining the relationship between the total resources available and the level of potential output. Within this context, utilization measures could establish significant yardsticks indicative of trends and cycles in capacity utilization.

Economists, particularly in the United States, in their efforts to measure capacity have developed a number of alternative methods varying from direct annual surveys to econometric models.

At present in Canada, the Department of Industry, Trade and Commerce produces an index of capacity utilization for the goods-producing industries by using the Wharton School trend-through-peak estimation procedures.<sup>(1)</sup> This index is derived from seasonally adjusted quarterly indexes of industrial production, which are charted and the peaks selected by inspection. These peaks are considered to be the capacity output of the industry. Successive capacity peaks are joined by a straight line to indicate the capacity during the intervening periods. Forward extrapolation of the same straight line generates capacity measures for periods following the last peak until the actual production index intersects the line.

Si l'on se place dans la perspective de l'utilisation des ressources disponibles, on constate une certaine similitude entre la main-d'oeuvre occupée et le stock de capital en place. Tout degré de sous-utilisation de l'une ou l'autre de ces ressources indique qu'il existe une différence entre leur utilisation potentielle et réelle. Cependant, si l'on tient compte des implications sociales et politiques de la non-utilisation des ressources disponibles, la différence entre les stocks de capital et la main-d'oeuvre s'accroît.

Il est reconnu que le stock de capital en place n'est pas utilisé dans la même proportion d'une année à l'autre. Depuis quelque temps, on cherche de plus en plus à mesurer d'une façon précise la différence entre le potentiel de productivité et la productivité réelle. Cette mesure de l'utilisation de la capacité peut servir à examiner la relation existant entre l'ensemble des ressources disponibles et le potentiel de production. De plus, une mesure de l'utilisation de la capacité pourrait servir à mesurer les tendances et les cycles à l'intérieur de celle-ci.

Dans le cadre de travaux sur la mesure de la capacité, des économistes, en particulier aux États-Unis, ont mis sur pied un certain nombre d'autres méthodes de quantification allant des enquêtes annuelles directes aux modèles économétriques.

Au Canada, le ministère de l'Industrie et du Commerce produit actuellement un indice de l'utilisation de la capacité pour les industries de biens d'après les méthodes d'estimation de la tendance générale par les sommets de l'école Wharton<sup>(1)</sup>. Cet indice est calculé à partir d'indices trimestriels désaisonnalisés de la production industrielle, qui sont reportés sur un graphique sur lequel on choisit les sommets. On considère que ces sommets représentent la capacité de production de l'industrie. Les différents sommets atteints au cours de chaque trimestre sont reliés par une ligne droite de façon à indiquer la capacité au cours de la période comprise entre deux sommets. Une extrapolation directe de cette même ligne droite permet de mesurer la capacité pour la période comprise entre le dernier sommet jusqu'à l'intersection par l'indice de la production réelle de la ligne droite.

<sup>(1)</sup> These indexes are published in **Rate of Capacity Utilization, Canada**. Department of Industry, Trade and Commerce, Ottawa.

<sup>(1)</sup> Ces indices sont publiés dans **Taux d'utilisation de la capacité**. Ministère de l'Industrie et du Commerce, Ottawa.

The Statistics Canada approach represents an alternative measure and is based on the capital-output ratio of each industry. It provides a basis for establishing the capacity output series with which actual output data are compared in order to derive the utilization rates. The definition of capacity in this procedure is the maximum output obtainable under "normal" technological and market conditions.

Some differences in level exist between the Statistics Canada series and those of the Department of Industry, Trade and Commerce. This situation is to be expected, of course, given the different estimation procedures underlying each set of measures.

The Statistical Tables show quarterly indexes of capacity utilization in Canadian manufacturing broken down into various major groups according to the 1970 **Standard Industrial Classification**.

The methodology used to produce these indexes is based on a comparison of the actual output of an industry during a certain time period with the estimated **capacity** output during that period.(2)

The estimated capacity output is based on a capacity capital-output ratio derived from the industry's gross stock of fixed capital, measured in 1971 dollars. These capital stock estimates are produced by the National Wealth and Capital Stock Section of Statistics Canada, and a brief outline of the method used to derive the estimates follows.(3)

The measurement procedure underlying the capital stock estimates is known as the "perpetual inventory" method. Briefly, this method involves the accumulation, over a period of years, of investment expenditures by industry to obtain its capital stock in any given year. The basic ingredients required are:

Annual investment series in current dollars by industry and category of expenditure;

price deflators relating to the investment-series; and

estimates of the average economic life of the assets used in the various industries.

(2) The concepts of capacity used follows the work of Daniel Creamer, "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, No. 72 National Industrial Conference Board, New York, 1961.

(3) Capital stock estimates are published in **Fixed Capital Flows and Stocks**, Catalogue 13-211, Annual.

L'approche de Statistique Canada est en fait un autre genre de mesure et repose sur le coefficient de capital de chaque industrie. Elle permet d'établir des séries sur la capacité de production que l'on compare aux données sur la production réelle de façon à obtenir les taux d'utilisation. La capacité, d'après cette méthode, se définit comme le maximum de biens que l'on peut produire dans des conditions technologiques et commerciales "normales".

Il existe certaines différences de niveau entre les séries de Statistique Canada et celles du ministère de l'Industrie et du Commerce. Il va sans dire que ces différences proviennent du fait que les méthodes d'estimation de chacun des ensembles de mesures sont différentes.

Les tableaux statistiques présentent des indices trimestriels de l'utilisation de la capacité pour les industries manufacturières du Canada ventilés en principaux groupes selon la **Classification des activités économiques**, de 1970.

La méthodologie inhérente au calcul de ces indices repose sur la comparaison de la production **réelle** d'une industrie au cours d'une certaine période avec la **capacité** estimée de production au cours de cette même période(2).

La capacité de production estimée est calculée d'après le coefficient de capital de capacité obtenu à partir du stock brut de capital fixe de l'industrie, mesuré en dollars de 1971. Ces estimations du stock de capital sont produites par la Section de la richesse nationale et du stock de capital de Statistique Canada. Voici une brève description de la méthode utilisée pour calculer les estimations(3).

La méthode de mesure des estimations de stocks de capital est celle de "l'inventaire perpétuel". En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissement de l'industrie pour obtenir son stock de capital pour une année donnée. Les éléments fondamentaux nécessaires sont:

Les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les différentes industries.

(2) La définition de la capacité utilisée ici est celle qu'a formulée Daniel Creamer dans "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, n° 72, National Industrial Conference Board, New York, 1961.

(3) Des estimations du stock de capital sont publiées dans **Flux et stocks de capital fixe**, n° 13-211 au catalogue, annuel.

To illustrate the mechanics of the "perpetual inventory" method, an example of the actual computing process is given. (Text Table I summarizes the computational procedure involved in this example.) Assume that the capital assets in a particular industry remain in production for 10 years before they are retired. We start with year one and adjusting for prices, we accumulate the investment expenditures pertaining to the types of capital assets in question for a period of 10 years. In the tenth year, a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year, we deduct from the accumulated total the investment expenditures of the first year and add the purchase of capital assets of the eleventh year. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimated. The net stock is equal to the difference between the cumulative value of past gross investment and cumulative depreciation.

The quarterly capital estimates are derived by applying a linear interpolation to the annual capital stocks. The stock estimates are adjusted for pollution abatement expenditures and then combined with the seasonally adjusted quarterly production indexes to derive quarterly capital-output ratios for the whole period. The production indexes for the Petroleum and Coal Industry are the gross output rather than the gross domestic product which are used for all other industries. It is felt that the gross output index better reflects the performance of the industry in the light of significant price changes.(4)

(4) The indexes of industrial production used are those published in **Gross Domestic Product by Industry**, Catalogues 61-213, and 61-005, Statistics Canada.

Pour expliquer le mécanisme de "l'inventaire perpétuel", voici un exemple du processus réel du calcul. (Le tableau explicatif I résume le processus du calcul.) Supposons que l'actif immobilisé de l'industrie demeure en production pendant 10 ans avant d'être retiré. On commence par la première année et, après déflation, on accumule les dépenses d'investissement se rapportant aux catégories de capital considérées pour une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs immobilisés de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif et on ajoute les achats d'actifs immobilisés au cours de la onzième année. On procède de la même façon pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs immobilisés à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Le stock net est égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée.

Les estimations trimestrielles de capital sont calculées d'après une interpolation linéaire des stocks annuels de capital. Ces estimations de stocks sont ajustées pour tenir compte des dépenses engagées au titre de la réduction de la pollution et ensuite combinées aux indices trimestriels désaisonnalisés de la production pour donner les coefficients de capital trimestriels pour l'ensemble de la période. L'indice de la production pour l'industrie des dérivés du pétrole et du charbon est l'indice de la production brute au lieu de celui du produit intérieur brut qui est utilisé dans les autres industries. En vue d'importants changements des prix, on croit que l'indice de la production brute soit plus représentatif de la performance de cette industrie(4).

(4) Les indices de la production industrielle utilisés ont été publiés dans **Produit intérieur brut par industrie**, n° 61-213 et 61-005 au catalogue, Statistique Canada.

These ratios are expressed in the Statistical Tables in constant 1971 dollars in order to show the degree of capital intensity in the various industries. The minimum capital-output ratio during this period indicates the historical capacity peak. When we divide the capital stocks series by the minimum capital-output ratio, we obtain a series of potential output.

As the final step in this procedure, actual data for individual production indexes are expressed as a ratio of the potential output series in percentage form to obtain the indexes of capacity utilization.

We summarize the procedure of measuring the capacity and operating rates in the following fashion:

Let  $K_t$  = fixed capital stocks at time  $t$ ,

let  $\frac{K_0}{P_0}$  = capacity capital-output ration

where  $K_0$  = fixed capital in benchmark period(5)

and  $P_0$  = capacity output in the same period,

let  $P_t$  = actual output at time  $t$ ,

and  $CP_t$  = estimated capacity output at time  $t$ .

Then  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = percentage of capacity utilized at time  $t$ ; that is, the capacity utilization rate.

Of course, in subsequent periods, if a lower capital-output ratio occurs, it is adopted as the capacity ratio, and the entire series is adjusted accordingly.

This formula was used to calculate the manufacturing industry capacity utilization rates shown in the Statistical Tables. The indexes for durable, non-durable and total

(5) As noted previously, this benchmark period is the time when the minimum capital-output ratio occurred.

Dans les Tableaux statistiques, ces coefficients sont exprimés en dollars constants de 1971 de façon à indiquer le degré d'intensité de capital des différentes industries. Le coefficient de capital minimum au cours de cette période indique le sommet historique de la capacité. Lorsqu'on divise les séries des stocks de capital par le coefficient de capital minimum, on obtient une série de la production potentielle.

Enfin, les données réelles pour les indices de production individuels sont exprimées en tant que ratio des séries de la production potentielle en pourcentage pour obtenir les indices de l'utilisation de la capacité.

Nous pouvons résumer ainsi la marche à suivre pour la mesure des taux d'utilisation de la capacité et d'activité:

Soit  $K_t$  = stocks de capital au temps  $t$ ,

et soit  $\frac{K_0}{P_0}$  = coefficient de capital de la capacité

où  $K_0$  = capital fixe au cours de la période repère(5)

et  $P_0$  = production potentielle au cours de la même période,

soit  $P_t$  = production réelle au temps  $t$ ,

et  $CP_t$  = production potentielle prévue au temps  $t$ .

Alors  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = pourcentage de la capacité utilisée au temps  $t$ ; c'est-à-dire le taux d'utilisation de la capacité.

Bien entendu, lorsque l'on enregistre un coefficient de capital plus bas, au cours des périodes qui suivent, on le considère comme étant le ratio de capacité, et toute la série est ajustée en conséquence.

Cette formule a été utilisée pour calculer les taux de l'utilisation de la capacité des industries manufacturières présentés dans les tableaux statistiques. Les indices ont été calculés par

(5) Comme il a été mentionné auparavant, cette période repère est le moment où l'on a enregistré le plus bas coefficient capital-production.

manufacturing were derived by aggregation, using the same weights as the 1971 Gross Domestic Product.(6)

The statistics presented here are only statistical estimates and they are not operating ratios based on either engineering measures, such as productive machine hours, or survey results.

(6) For the period prior to 1971 the data are not available on a 1971 base. To obtain a continuous record on a 1971 base, the indexes on a 1961 base were mechanically rebased to 1971 by multiplying by 100.0 and dividing by the 1971 index value on a 1961 base. An adjustment has been made to the production indexes for Rubber and Plastics Products, and Miscellaneous Manufacturing, based on the annual Real Domestic Product Indexes, to capture the trend of the individual industries according to the 1970 Standard Industrial Classification, from 1961 to 1970.

agrégation tant pour l'ensemble des industries manufacturières que pour les industries des biens durables et non durables à partir des mêmes pondérations que celles pour du produit intérieur brut de 1971(6).

Ces chiffres représentent uniquement des approximations et ne sont pas des coefficients de fonctionnement basés sur des mesures industrielles, comme les heures de production des machines, ni des résultats d'une enquête.

(6) En ce qui concerne les années antérieures à 1971, les données ne sont pas disponibles sur la base 1971 = 100. Pour obtenir une continuité des données de ces années, les indices sur la base 1961 = 100 furent convertis arithmétiquement à l'année de référence 1971 en les multipliant par 100.0 et en divisant le produit obtenu par la valeur de l'indice de 1971 sur la base de 1961 = 100. On a ajusté les indices de production de l'industrie du caoutchouc et des produits en matière plastique, et des industries manufacturières diverses, basés sur l'indice annuel du produit intérieur réel de façon à connaître la tendance des industries selon la Classification des activités économiques de 1970, pour la période de 1961 à 1970.

Given the many conceptual and measurement problems surrounding the notion of capacity utilization, the utilization rates shown here are indicative of trends and cycles in the utilization of capital. The indicated level is only a statistical approximation and should be viewed as such. For example, a rate of 100% indicates a high level of capital utilization which is considered a peak for the period observed.

Étant donné qu'il existe plusieurs problèmes relatifs à la notion du taux d'utilisation, il conviendrait de noter que les taux d'utilisation publiés ne constituent pas des mesures exactes, mais des statistiques indiquant les tendances et les cycles d'utilisation du stock de capital fixe. Par exemple, un taux de 100% indique un haut niveau de l'utilisation de capital qui est considéré un sommet pendant la période observée.

	Chemical and chemical products - Produits chimiques	1.359	1,131.2
	Miscellaneous manufacturing - Industries diverses	0.654	544.4

## HIGHLIGHTS

The utilization rates for the third quarter 1983 appearing in this publication correspond to those released on December 2, 1983 in the Statistics Canada Daily and CANSIM.

Capacity utilization in Canadian manufacturing industries continued to rise in the third quarter of 1983, increasing 3.5% to a level of 70.5% from 68.1% in the second quarter. Although five of the 20 industry groupings posted lower capacity utilization rates, this was more than offset by the industries which recorded increases in their rates: the two most important gains were 16.8% in the wood industries group and 13.8% in the petroleum and coal products group.

However, while the capacity utilization rate for the total manufacturing group has been steadily increasing over the last three quarters, the rate is still well below the 81.5% level recorded in the second quarter of 1981.

Durable manufacturing industries recorded a 5.6% increase in capacity utilization, moving to 63.6% in the third quarter of 1983 from 60.2% in the second quarter, while in the non-durable sector the increase was 2.1% to 77.7% from 76.1%.

## FAITS SAILLANTS

Les taux d'utilisation publiés dans ce numéro du troisième trimestre de 1983 correspondent à ceux parus dans le Quotidien de Statistique Canada du 2 décembre 1983 et dans CANSIM.

L'utilisation de la capacité dans les industries manufacturières canadiennes a continué d'augmenter au troisième trimestre de 1983 au rythme de 3.5%, passant ainsi de 68.1% au deuxième trimestre à 70.5% au troisième. Bien que cinq des 20 groupes industriels accusent une diminution de leurs taux d'utilisation, celle-ci a été neutralisée par les augmentations que les autres industries ont enregistrées. Les deux hausses les plus importantes sont celles du groupe des industries du bois (+ 16.8%) et du groupe des dérivés du pétrole et du charbon (+ 13.8%).

Bien que le taux d'utilisation du secteur de la fabrication dans son ensemble ait augmenté de façon soutenue au cours des trois derniers trimestres, il n'en est pas moins toujours bien inférieur à son niveau de 81.5% enregistré au deuxième trimestre de 1981.

L'utilisation de la capacité dans le cas des industries de biens durables a augmenté de 5.6%, passant de 60.2% au deuxième trimestre de 1983 à 63.6% au troisième, tandis que dans celui des industries de biens non durables, elle s'est accrue de 2.1%, passant de 76.1% à 77.7%.

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer printouts, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 9Z9 (Telephone: 995-8152) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et du stock de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 9Z9 (téléphone: 995-8152) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

.. figures not available.

... figures not appropriate or not applicable.

- nil or zero.

-- amount too small to be expressed.

P preliminary figures.

r revised figures.

x confidential to meet secrecy requirements of the Statistics Act.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

.. nombres indisponibles.

... n'ayant pas lieu de figurer.

- néant ou zéro.

-- nombres infimes.

P nombres provisoires.

r nombres rectifiés.

x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

## INTRODUCTION

From the point of view of utilization of resources available for the production of goods, there is a significant similarity between the labour force and the stock of capital in place. Any degree of under-utilization in either type of resource indicates the gap between potential and actual use of these resources. However, when the socio-political implications of unemployed resources are considered, then the difference between capital stocks and labour becomes substantial.

It is common knowledge that the stock of capital in place typically is not used with the same degree of intensity over the year. Recently, increasing attention has been focused on the measurement of productive potential and the extent to which it is realized. This capacity utilization measurement is an interesting way of examining the relationship between the total resources available and the level of potential output. Within this context, utilization measures could establish significant yardsticks indicative of trends and cycles in capacity utilization.

Economists, particularly in the United States, in their efforts to measure capacity have developed a number of alternative methods varying from direct annual surveys to econometric models.

At present in Canada, the Department of Industry, Trade and Commerce produces an index of capacity utilization for the goods-producing industries by using the Wharton School trend-through-peak estimation procedures.<sup>(1)</sup> This index is derived from seasonally adjusted quarterly indexes of industrial production, which are charted and the peaks selected by inspection. These peaks are considered to be the capacity output of the industry. Successive capacity peaks are joined by a straight line to indicate the capacity during the intervening periods. Forward extrapolation of the same straight line generates capacity measures for periods following the last peak until the actual production index intersects the line.

Si l'on se place dans la perspective de l'utilisation des ressources disponibles, on constate une certaine similitude entre la main-d'oeuvre occupée et le stock de capital en place. Tout degré de sous-utilisation de l'une ou l'autre de ces ressources indique qu'il existe une différence entre leur utilisation potentielle et réelle. Cependant, si l'on tient compte des implications sociales et politiques de la non-utilisation des ressources disponibles, la différence entre les stocks de capital et la main-d'oeuvre s'accroît.

Il est reconnu que le stock de capital en place n'est pas utilisé dans la même proportion d'une année à l'autre. Depuis quelque temps, on cherche de plus en plus à mesurer d'une façon précise la différence entre le potentiel de productivité et la productivité réelle. Cette mesure de l'utilisation de la capacité peut servir à examiner la relation existant entre l'ensemble des ressources disponibles et le potentiel de production. De plus, une mesure de l'utilisation de la capacité pourrait servir à mesurer les tendances et les cycles à l'intérieur de celle-ci.

Dans le cadre de travaux sur la mesure de la capacité, des économistes, en particulier aux États-Unis, ont mis sur pied un certain nombre d'autres méthodes de quantification allant des enquêtes annuelles directes aux modèles économétriques.

Au Canada, le ministère de l'Industrie et du Commerce produit actuellement un indice de l'utilisation de la capacité pour les industries de biens d'après les méthodes d'estimation de la tendance générale par les sommets de l'école Wharton<sup>(1)</sup>. Cet indice est calculé à partir d'indices trimestriels désaisonnalisés de la production industrielle, qui sont reportés sur un graphique sur lequel on choisit les sommets. On considère que ces sommets représentent la capacité de production de l'industrie. Les différents sommets atteints au cours de chaque trimestre sont reliés par une ligne droite de façon à indiquer la capacité au cours de la période comprise entre deux sommets. Une extrapolation directe de cette même ligne droite permet de mesurer la capacité pour la période comprise entre le dernier sommet jusqu'à l'intersection par l'indice de la production réelle de la ligne droite.

<sup>(1)</sup> These indexes are published in **Rate of Capacity Utilization, Canada**. Department of Industry, Trade and Commerce, Ottawa.

<sup>(1)</sup> Ces indices sont publiés dans **Taux d'utilisation de la capacité**. Ministère de l'Industrie et du Commerce, Ottawa.

The Statistics Canada approach represents an alternative measure and is based on the capital-output ratio of each industry. It provides a basis for establishing the capacity output series with which actual output data are compared in order to derive the utilization rates. The definition of capacity in this procedure is the maximum output obtainable under "normal" technological and market conditions.

Some differences in level exist between the Statistics Canada series and those of the Department of Industry, Trade and Commerce. This situation is to be expected, of course, given the different estimation procedures underlying each set of measures.

The Statistical Tables show quarterly indexes of capacity utilization in Canadian manufacturing broken down into various major groups according to the 1970 **Standard Industrial Classification**.

The methodology used to produce these indexes is based on a comparison of the actual output of an industry during a certain time period with the estimated capacity output during that period.(2)

The estimated capacity output is based on a capacity capital-output ratio derived from the industry's gross stock of fixed capital, measured in 1971 dollars. These capital stock estimates are produced by the National Wealth and Capital Stock Section of Statistics Canada, and a brief outline of the method used to derive the estimates follows.(3)

The measurement procedure underlying the capital stock estimates is known as the "perpetual inventory" method. Briefly, this method involves the accumulation, over a period of years, of investment expenditures by industry to obtain its capital stock in any given year. The basic ingredients required are:

Annual investment series in current dollars by industry and category of expenditure;

price deflators relating to the investment-series; and

estimates of the average economic life of the assets used in the various industries.

(2) The concepts of capacity used follows the work of Daniel Creamer, "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, No. 72 National Industrial Conference Board, New York, 1961.

(3) Capital stock estimates are published in **Fixed Capital Flows and Stocks**, Catalogue 13-211, Annual.

L'approche de Statistique Canada est en fait un autre genre de mesure et repose sur le coefficient de capital de chaque industrie. Elle permet d'établir des séries sur la capacité de production que l'on compare aux données sur la production réelle de façon à obtenir les taux d'utilisation. La capacité, d'après cette méthode, se définit comme le maximum de biens que l'on peut produire dans des conditions technologiques et commerciales "normales".

Il existe certaines différences de niveau entre les séries de Statistique Canada et celles du ministère de l'Industrie et du Commerce. Il va sans dire que ces différences proviennent du fait que les méthodes d'estimation de chacun des ensembles de mesures sont différentes.

Les tableaux statistiques présentent des indices trimestriels de l'utilisation de la capacité pour les industries manufacturières du Canada ventilés en principaux groupes selon la **Classification des activités économiques**, de 1970.

La méthodologie inhérente au calcul de ces indices repose sur la comparaison de la production réelle d'une industrie au cours d'une certaine période avec la capacité estimée de production au cours de cette même période(2).

La capacité de production estimée est calculée d'après le coefficient de capital de capacité obtenu à partir du stock brut de capital fixe de l'industrie, mesuré en dollars de 1971. Ces estimations du stock de capital sont produites par la Section de la richesse nationale et du stock de capital de Statistique Canada. Voici une brève description de la méthode utilisée pour calculer les estimations(3).

La méthode de mesure des estimations de stocks de capital est celle de "l'inventaire perpétuel". En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissement de l'industrie pour obtenir son stock de capital pour une année donnée. Les éléments fondamentaux nécessaires sont:

Les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les différentes industries.

(2) La définition de la capacité utilisée ici est celle qu'a formulée Daniel Creamer dans "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, n° 72, National Industrial Conference Board, New York, 1961.

(3) Des estimations du stock de capital sont publiées dans **Flux et stocks de capital fixe**, n° 13-211 au catalogue, annuel.

To illustrate the mechanics of the "perpetual inventory" method, an example of the actual computing process is given. (Text Table I summarizes the computational procedure involved in this example.) Assume that the capital assets in a particular industry remain in production for 10 years before they are retired. We start with year one and adjusting for prices, we accumulate the investment expenditures pertaining to the types of capital assets in question for a period of 10 years. In the tenth year, a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year, we deduct from the accumulated total the investment expenditures of the first year and add the purchase of capital assets of the eleventh year. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimated. The net stock is equal to the difference between the cumulative value of past gross investment and cumulative depreciation.

The quarterly capital estimates are derived by applying a linear interpolation to the annual capital stocks. The stock estimates are adjusted for pollution abatement expenditures and then combined with the seasonally adjusted quarterly production indexes to derive quarterly capital-output ratios for the whole period. The production indexes for the Petroleum and Coal Industry are the gross output rather than the gross domestic product which are used for all other industries. It is felt that the gross output index better reflects the performance of the industry in the light of significant price changes.(4)

(4) The indexes of industrial production used are those published in **Gross Domestic Product by Industry**, Catalogues 61-213, and 61-005, Statistics Canada.

Pour expliquer le mécanisme de "l'inventaire perpétuel", voici un exemple du processus réel du calcul. (Le tableau explicatif I résume le processus du calcul.) Supposons que l'actif immobilisé de l'industrie demeure en production pendant 10 ans avant d'être retiré. On commence par la première année et, après déflation, on accumule les dépenses d'investissement se rapportant aux catégories de capital considérées pour une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs immobilisés de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif et on ajoute les achats d'actifs immobilisés au cours de la onzième année. On procède de la même façon pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs immobilisés à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Le stock net est égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée.

Les estimations trimestrielles de capital sont calculées d'après une interpolation linéaire des stocks annuels de capital. Ces estimations de stocks sont ajustées pour tenir compte des dépenses engagées au titre de la réduction de la pollution et ensuite combinées aux indices trimestriels désaisonnalisés de la production pour donner les coefficients de capital trimestriels pour l'ensemble de la période. L'indice de la production pour l'industrie des dérivés du pétrole et du charbon est l'indice de la production brute au lieu de celui du produit intérieur brut qui est utilisé dans les autres industries. En vue d'importants changements des prix, on croit que l'indice de la production brute soit plus représentatif de la performance de cette industrie(4).

(4) Les indices de la production industrielle utilisés ont été publiés dans **Produit intérieur brut par industrie**, n° 61-213 et 61-005 au catalogue, Statistique Canada.

These ratios are expressed in the Statistical Tables in constant 1971 dollars in order to show the degree of capital intensity in the various industries. The minimum capital-output ratio during this period indicates the historical capacity peak. When we divide the capital stocks series by the minimum capital-output ratio, we obtain a series of potential output.

As the final step in this procedure, actual data for individual production indexes are expressed as a ratio of the potential output series in percentage form to obtain the indexes of capacity utilization.

We summarize the procedure of measuring the capacity and operating rates in the following fashion:

Let  $K_t$  = fixed capital stocks at time  $t$ ,

let  $\frac{K_0}{P_0}$  = capacity capital-output ration

where  $K_0$  = fixed capital in benchmark period(5)

and  $P_0$  = capacity output in the same period,

let  $P_t$  = actual output at time  $t$ ,

and  $CP_t$  = estimated capacity output at time  $t$ .

Then  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = percentage of capacity utilized at time  $t$ ; that is, the capacity utilization rate.

Of course, in subsequent periods, if a lower capital-output ratio occurs, it is adopted as the capacity ratio, and the entire series is adjusted accordingly.

This formula was used to calculate the manufacturing industry capacity utilization rates shown in the Statistical Tables. The indexes for durable, non-durable and total

Dans les Tableaux statistiques, ces coefficients sont exprimés en dollars constants de 1971 de façon à indiquer le degré d'intensité de capital des différentes industries. Le coefficient de capital minimum au cours de cette période indique le sommet historique de la capacité. Lorsqu'on divise les séries des stocks de capital par le coefficient de capital minimum, on obtient une série de la production potentielle.

Enfin, les données réelles pour les indices de production individuels sont exprimées en tant que ratio des séries de la production potentielle en pourcentage pour obtenir les indices de l'utilisation de la capacité.

Nous pouvons résumer ainsi la marche à suivre pour la mesure des taux d'utilisation de la capacité et d'activité:

Soit  $K_t$  = stocks de capital au temps  $t$ ,

et soit  $\frac{K_0}{P_0}$  = coefficient de capital de la capacité

où  $K_0$  = capital fixe au cours de la période repère(5)

et  $P_0$  = production potentielle au cours de la même période,

soit  $P_t$  = production réelle au temps  $t$ ,

et  $CP_t$  = production potentielle prévue au temps  $t$ .

Alors  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = pourcentage de la capacité utilisée au temps  $t$ ; c'est-à-dire le taux d'utilisation de la capacité.

Bien entendu, lorsque l'on enregistre un coefficient de capital plus bas, au cours des périodes qui suivent, on le considère comme étant le ratio de capacité, et toute la série est ajustée en conséquence.

Cette formule a été utilisée pour calculer les taux de l'utilisation de la capacité des industries manufacturières présentés dans les Tableaux statistiques. Les indices ont été calculés par

(5) As noted previously, this benchmark period is the time when the minimum capital-output ratio occurred.

(5) Comme il a été mentionné auparavant, cette période repère est le moment où l'on a enregistré le plus bas coefficient capital-production.

TEXT TABLE I. Example: Assumed Service Life = 10 Years = L

TABLEAU EXPLICATIF I. Exemple: Durée de vie supposée de 10 ans = L

12	21.8	1.000	21.8	43.9	- 22.1	244.3	25.5	- 3.7	123.8

manufacturing were derived by aggregation, using the same weights as the 1971 Gross Domestic Product.(6)

The statistics presented here are only statistical estimates and they are not operating ratios based on either engineering measures, such as productive machine hours, or survey results.

(6) For the period prior to 1971 the data are not available on a 1971 base. To obtain a continuous record on a 1971 base, the indexes on a 1961 base were mechanically rebased to 1971 by multiplying by 100.0 and dividing by the 1971 index value on a 1961 base. An adjustment has been made to the production indexes for Rubber and Plastics Products, and Miscellaneous Manufacturing, based on the annual Real Domestic Product Indexes, to capture the trend of the individual industries according to the 1970 Standard Industrial Classification, from 1961 to 1970.

agrégation tant pour l'ensemble des industries manufacturières que pour les industries des biens durables et non durables à partir des mêmes pondérations que celles pour du produit intérieur brut de 1971(6).

Ces chiffres représentent uniquement des approximations et ne sont pas des coefficients de fonctionnement basés sur des mesures industrielles, comme les heures de production des machines, ni des résultats d'une enquête.

(6) En ce qui concerne les années antérieures à 1971, les données ne sont pas disponibles sur la base 1971 = 100. Pour obtenir une continuité des données de ces années, les indices sur la base 1961 = 100 furent convertis arithmétiquement à l'année de référence 1971 en les multipliant par 100.0 et en divisant le produit obtenu par la valeur de l'indice de 1971 sur la base de 1961 = 100. On a ajusté les indices de production de l'industrie du caoutchouc et des produits en matière plastique, et des industries manufacturières diverses, basés sur l'indice annuel du produit intérieur réel de façon à connaître la tendance des industries selon la Classification des activités économiques de 1970, pour la période de 1961 à 1970.

Given the many conceptual and measurement problems surrounding the notion of capacity utilization, the utilization rates shown here are indicative of trends and cycles in the utilization of capital. The indicated level is only a statistical approximation and should be viewed as such. For example, a rate of 100% indicates a high level of capital utilization which is considered a peak for the period observed.

Étant donné qu'il existe plusieurs problèmes relatifs à la notion du taux d'utilisation, il conviendrait de noter que les taux d'utilisation publiés ne constituent pas des mesures exactes, mais des statistiques indiquant les tendances et les cycles d'utilisation du stock de capital fixe. Par exemple, un taux de 100% indique un haut niveau de l'utilisation de capital qui est considéré un sommet pendant la période observée.

	Petroleum and coal products - Dérivés du pétrole et du charbon	0.315	262.5
	Chemical and chemical products - Produits chimiques	1.359	1,131.2
	Miscellaneous manufacturing - Industries diverses	0.654	544.4

## HIGHLIGHTS

The utilization rates for the fourth quarter 1983 appearing in this publication correspond to those released on March 13, 1984 in the Statistics Canada Daily and CANSIM.

Capacity utilization in Canadian manufacturing industries continued to rise in the fourth quarter of 1983, increasing 2.5% to a level of 72.4% from 70.6% in the third quarter. Although five of the 20 industry groupings posted lower capacity utilization rates, the declines were more than offset by the industries which recorded higher rates: the two most important gains were 13.3% in the transportation equipment industries and 11.6% in the machinery group.

However, while the capacity utilization rate for the total manufacturing group has been steadily increasing over the last four quarters, the rate is still well below the 81.5% level recorded in the second quarter of 1981, just before the recession began.

Utilization rates in durable manufacturing industries recorded a 4.6% increase in the fourth quarter of 1983, rising to 66.5% of capacity from 63.6% in the third quarter, while in the non-durable sector the increase was 0.9% to 78.5% from 77.8%.

## FAITS SAILLANTS

Les taux d'utilisation publiés dans ce numéro du quatrième trimestre de 1983 correspondent à ceux parus dans le Quotidien de Statistique Canada du 13 mars 1984 et dans CANSIM.

L'utilisation de la capacité dans les industries manufacturières canadiennes a continué d'augmenter au cours des trois derniers mois de 1983, en effet, elle s'est accrue de 2.5% pour atteindre 72.4% au quatrième trimestre comparativement à 70.6% au troisième. Bien qu'il se soit produit une baisse du taux d'utilisation dans cinq des 20 groupes industriels, les hausses enregistrées par les autres industries ont largement compensé cette baisse. Les deux augmentations les plus importantes ont été celle du groupe du matériel de transport (13.3%) et celle du groupe des machines (11.6%).

Cependant, même si le taux d'utilisation dans l'ensemble du secteur de la fabrication a progressé d'une manière soutenue au cours des quatre derniers trimestres, il n'en est pas moins demeuré inférieur à son niveau de 81.5% observé au deuxième trimestre de 1981.

L'utilisation de la capacité dans les industries manufacturières de biens durables a marqué une avance de 4.6%, passant de 63.6% au troisième trimestre à 66.5% au quatrième, tandis que dans les industries manufacturières de biens non durables, elle s'est accrue de 0.9%, passant de 77.8% à 78.5%.

### Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

### How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 9Z9 (Telephone: 990-9684) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831
Ontario	1-800-268-1151
Manitoba	1-800-282-8006
Saskatchewan	1(112)800-667-3524
Alberta	1-800-222-6400
British Columbia (South and Central)	112-800-663-1551
Yukon and Northern B.C. (area served by NorthwTel Inc.)	Zenith 0-8913
Northwest Territories (area served by NorthwTel Inc.)	Zenith 2-2015

### How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6.

### Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

### Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et du stock de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 9Z9 (téléphone: 990-9684) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

Terre-Neuve et Labrador	Zénith 0-7037
Nouvelle-Écosse, Nouveau-Brunswick et Île-du-Prince-Édouard	1-800-565-7192

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- .. nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- P nombres provisoires.
- r nombres rectifiés.
- x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

## INTRODUCTION

From the point of view of utilization of resources available for the production of goods, there is a significant similarity between the labour force and the stock of capital in place. Any degree of under-utilization in either type of resource indicates the gap between potential and actual use of these resources. However, when the socio-political implications of unemployed resources are considered, then the difference between capital stocks and labour becomes substantial.

It is common knowledge that the stock of capital in place typically is not used with the same degree of intensity over the year. Recently, increasing attention has been focused on the measurement of productive potential and the extent to which it is realized. This capacity utilization measurement is an interesting way of examining the relationship between the total resources available and the level of potential output. Within this context, utilization measures could establish significant yardsticks indicative of trends and cycles in capacity utilization.

Economists, particularly in the United States, in their efforts to measure capacity have developed a number of alternative methods varying from direct annual surveys to econometric models.

At present in Canada, the Department of Industry, Trade and Commerce produces an index of capacity utilization for the goods-producing industries by using the Wharton School trend-through-peak estimation procedures.<sup>(1)</sup> This index is derived from seasonally adjusted quarterly indexes of industrial production, which are charted and the peaks selected by inspection. These peaks are considered to be the capacity output of the industry. Successive capacity peaks are joined by a straight line to indicate the capacity during the intervening periods. Forward extrapolation of the same straight line generates capacity measures for periods following the last peak until the actual production index intersects the line.

<sup>(1)</sup> These indexes are published in **Rate of Capacity Utilization, Canada**. Department of Industry, Trade and Commerce, Ottawa.

Si l'on se place dans la perspective de l'utilisation des ressources disponibles, on constate une certaine similitude entre la main-d'oeuvre occupée et le stock de capital en place. Tout degré de sous-utilisation de l'une ou l'autre de ces ressources indique qu'il existe une différence entre leur utilisation potentielle et réelle. Cependant, si l'on tient compte des implications sociales et politiques de la non-utilisation des ressources disponibles, la différence entre les stocks de capital et la main-d'oeuvre s'accroît.

Il est reconnu que le stock de capital en place n'est pas utilisé dans la même proportion d'une année à l'autre. Depuis quelque temps, on cherche de plus en plus à mesurer d'une façon précise la différence entre le potentiel de productivité et la productivité réelle. Cette mesure de l'utilisation de la capacité peut servir à examiner la relation existant entre l'ensemble des ressources disponibles et le potentiel de production. De plus, une mesure de l'utilisation de la capacité pourrait servir à mesurer les tendances et les cycles à l'intérieur de celle-ci.

Dans le cadre de travaux sur la mesure de la capacité, des économistes, en particulier aux États-Unis, ont mis sur pied un certain nombre d'autres méthodes de quantification allant des enquêtes annuelles directes aux modèles économétriques.

Au Canada, le ministère de l'Industrie et du Commerce produit actuellement un indice de l'utilisation de la capacité pour les industries de biens d'après les méthodes d'estimation de la tendance générale par les sommets de l'école Wharton<sup>(1)</sup>. Cet indice est calculé à partir d'indices trimestriels désaisonnalisés de la production industrielle, qui sont reportés sur un graphique sur lequel on choisit les sommets. On considère que ces sommets représentent la capacité de production de l'industrie. Les différents sommets atteints au cours de chaque trimestre sont reliés par une ligne droite de façon à indiquer la capacité au cours de la période comprise entre deux sommets. Une extrapolation directe de cette même ligne droite permet de mesurer la capacité pour la période comprise entre le dernier sommet jusqu'à l'intersection par l'indice de la production réelle de la ligne droite.

<sup>(1)</sup> Ces indices sont publiés dans **Taux d'utilisation de la capacité**. Ministère de l'Industrie et du Commerce, Ottawa.

The Statistics Canada approach represents an alternative measure and is based on the capital-output ratio of each industry. It provides a basis for establishing the capacity output series with which actual output data are compared in order to derive the utilization rates. The definition of capacity in this procedure is the maximum output obtainable under "normal" technological and market conditions.

Some differences in level exist between the Statistics Canada series and those of the Department of Industry, Trade and Commerce. This situation is to be expected, of course, given the different estimation procedures underlying each set of measures.

The Statistical Tables show quarterly indexes of capacity utilization in Canadian manufacturing broken down into various major groups according to the 1970 **Standard Industrial Classification**.

The methodology used to produce these indexes is based on a comparison of the **actual** output of an industry during a certain time period with the estimated **capacity** output during that period.(2)

The estimated capacity output is based on a capacity capital-output ratio derived from the industry's gross stock of fixed capital, measured in 1971 dollars. These capital stock estimates are produced by the National Wealth and Capital Stock Section of Statistics Canada, and a brief outline of the method used to derive the estimates follows.(3)

The measurement procedure underlying the capital stock estimates is known as the "perpetual inventory" method. Briefly, this method involves the accumulation, over a period of years, of investment expenditures by industry to obtain its capital stock in any given year. The basic ingredients required are:

Annual investment series in current dollars by industry and category of expenditure;

price deflators relating to the investment-series; and

estimates of the average economic life of the assets used in the various industries.

(2) The concepts of capacity used follows the work of Daniel Creamer, "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, No. 72 National Industrial Conference Board, New York, 1961.

(3) Capital stock estimates are published in **Fixed Capital Flows and Stocks**, Catalogue 13-211, Annual.

L'approche de Statistique Canada est en fait un autre genre de mesure et repose sur le coefficient de capital de chaque industrie. Elle permet d'établir des séries sur la capacité de production que l'on compare aux données sur la production réelle de façon à obtenir les taux d'utilisation. La capacité, d'après cette méthode, se définit comme le maximum de biens que l'on peut produire dans des conditions technologiques et commerciales "normales".

Il existe certaines différences de niveau entre les séries de Statistique Canada et celles du ministère de l'Industrie et du Commerce. Il va sans dire que ces différences proviennent du fait que les méthodes d'estimation de chacun des ensembles de mesures sont différentes.

Les tableaux statistiques présentent des indices trimestriels de l'utilisation de la capacité pour les industries manufacturières du Canada ventilés en principaux groupes selon la **Classification des activités économiques**, de 1970.

La méthodologie inhérente au calcul de ces indices repose sur la comparaison de la production **réelle** d'une industrie au cours d'une certaine période avec la **capacité** estimée de production au cours de cette même période(2).

La capacité de production estimée est calculée d'après le coefficient de capital de capacité obtenu à partir du stock brut de capital fixe de l'industrie, mesuré en dollars de 1971. Ces estimations du stock de capital sont produites par la Section de la richesse nationale et du stock de capital de Statistique Canada. Voici une brève description de la méthode utilisée pour calculer les estimations(3).

La méthode de mesure des estimations de stocks de capital est celle de "l'inventaire perpétuel". En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissement de l'industrie pour obtenir son stock de capital pour une année donnée. Les éléments fondamentaux nécessaires sont:

Les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les différentes industries.

(2) La définition de la capacité utilisée ici est celle qu'a formulée Daniel Creamer dans "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, n° 72, National Industrial Conference Board, New York, 1961.

(3) Des estimations du stock de capital sont publiées dans **Flux et stocks de capital fixe**, n° 13-211 au catalogue, annuel.

To illustrate the mechanics of the "perpetual inventory" method, an example of the actual computing process is given. (Text Table I summarizes the computational procedure involved in this example.) Assume that the capital assets in a particular industry remain in production for 10 years before they are retired. We start with year one and adjusting for prices, we accumulate the investment expenditures pertaining to the types of capital assets in question for a period of 10 years. In the tenth year, a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year, we deduct from the accumulated total the investment expenditures of the first year and add the purchase of capital assets of the eleventh year. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimated. The net stock is equal to the difference between the cumulative value of past gross investment and cumulative depreciation.

The quarterly capital estimates are derived by applying a linear interpolation to the annual capital stocks. The stock estimates are then combined with the seasonally adjusted quarterly production indexes to derive quarterly capital-output ratios for the whole period. The production indexes for the Petroleum and Coal Industry are the gross output rather than the gross domestic product which are used for all other industries. It is felt that the gross output index better reflects the performance of the industry in the light of significant price changes.(4)

(4) The indexes of industrial production used are those published in **Gross Domestic Product by Industry**, Catalogues 61-213, and 61-005, Statistics Canada.

Pour expliquer le mécanisme de "l'inventaire perpétuel", voici un exemple du processus réel du calcul. (Le tableau explicatif I résume le processus du calcul.) Supposons que l'actif immobilisé de l'industrie demeure en production pendant 10 ans avant d'être retiré. On commence par la première année et, après déflation, on accumule les dépenses d'investissement se rapportant aux catégories de capital considérées pour une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs immobilisés de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif et on ajoute les achats d'actifs immobilisés au cours de la onzième année. On procède de la même façon pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs immobilisés à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Le stock net est égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée.

Les estimations trimestrielles de capital sont calculées d'après une interpolation linéaire des stocks annuels de capital. Ces estimations de stocks sont ajustées pour tenir compte des dépenses engagées au titre de la réduction de la pollution et ensuite combinées aux indices trimestriels désaisonnalisés de la production pour donner les coefficients de capital trimestriels pour l'ensemble de la période. L'indice de la production pour l'industrie des dérivés du pétrole et du charbon est l'indice de la production brute au lieu de celui du produit intérieur brut qui est utilisé dans les autres industries. En vue d'importants changements des prix, on croit que l'indice de la production brute soit plus représentatif de la performance de cette industrie(4).

(4) Les indices de la production industrielle utilisés ont été publiés dans **Produit intérieur brut par industrie**, n° 61-213 et 61-005 au catalogue, Statistique Canada.

These ratios are expressed in the Statistical Tables in constant 1971 dollars in order to show the degree of capital intensity in the various industries. The minimum capital-output ratio during this period indicates the historical capacity peak. When we divide the capital stocks series by the minimum capital-output ratio, we obtain a series of potential output.

As the final step in this procedure, actual data for individual production indexes are expressed as a ratio of the potential output series in percentage form to obtain the indexes of capacity utilization.

We summarize the procedure of measuring the capacity and operating rates in the following fashion:

Let  $K_t$  = fixed capital stocks at time  $t$ ,

let  $\frac{K_0}{P_0}$  = capacity capital-output ration

where  $K_0$  = fixed capital in benchmark period<sup>(5)</sup>

and  $P_0$  = capacity output in the same period,

let  $P_t$  = actual output at time  $t$ ,

and  $CP_t$  = estimated capacity output at time  $t$ .

Then  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = percentage of capacity utilized at time  $t$ ; that is, the capacity utilization rate.

Of course, in subsequent periods, if a lower capital-output ratio occurs, it is adopted as the capacity ratio, and the entire series is adjusted accordingly.

This formula was used to calculate the manufacturing industry capacity utilization rates shown in the Statistical Tables. The indexes for durable, non-durable and total

Dans les Tableaux statistiques, ces coefficients sont exprimés en dollars constants de 1971 de façon à indiquer le degré d'intensité de capital des différentes industries. Le coefficient de capital minimum au cours de cette période indique le sommet historique de la capacité. Lorsqu'on divise les séries des stocks de capital par le coefficient de capital minimum, on obtient une série de la production potentielle.

Enfin, les données réelles pour les indices de production individuels sont exprimées en tant que ratio des séries de la production potentielle en pourcentage pour obtenir les indices de l'utilisation de la capacité.

Nous pouvons résumer ainsi la marche à suivre pour la mesure des taux d'utilisation de la capacité et d'activité:

Soit  $K_t$  = stocks de capital au temps  $t$ ,

et soit  $\frac{K_0}{P_0}$  = coefficient de capital de la capacité

où  $K_0$  = capital fixe au cours de la période repère<sup>(5)</sup>

et  $P_0$  = production potentielle au cours de la même période,

soit  $P_t$  = production réelle au temps  $t$ ,

et  $CP_t$  = production potentielle prévue au temps  $t$ .

Alors  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = pourcentage de la capacité utilisée au temps  $t$ ; c'est-à-dire le taux d'utilisation de la capacité.

Bien entendu, lorsque l'on enregistre un coefficient de capital plus bas, au cours des périodes qui suivent, on le considère comme étant le ratio de capacité, et toute la série est ajustée en conséquence.

Cette formule a été utilisée pour calculer les taux de l'utilisation de la capacité des industries manufacturières présentés dans les Tableaux statistiques. Les indices ont été calculés par

(5) As noted previously, this benchmark period is the time when the minimum capital-output ratio occurred.

(5) Comme il a été mentionné auparavant, cette période repère est le moment où l'on a enregistré le plus bas coefficient capital-production.

manufacturing were derived by aggregation, using the same weights as the 1971 Gross Domestic Product.(6)

The statistics presented here are only statistical estimates and they are not operating ratios based on either engineering measures, such as productive machine hours, or survey results.

(6) For the period prior to 1971 the data are not available on a 1971 base. To obtain a continuous record on a 1971 base, the indexes on a 1961 base were mechanically rebased to 1971 by multiplying by 100.0 and dividing by the 1971 index value on a 1961 base. An adjustment has been made to the production indexes for Rubber and Plastics Products, and Miscellaneous Manufacturing, based on the annual Real Domestic Product Indexes, to capture the trend of the individual industries according to the 1970 Standard Industrial Classification, from 1961 to 1970.

agrégation tant pour l'ensemble des industries manufacturières que pour les industries des biens durables et non durables à partir des mêmes pondérations que celles pour du produit intérieur brut de 1971(6).

Ces chiffres représentent uniquement des approximations et ne sont pas des coefficients de fonctionnement basés sur des mesures industrielles, comme les heures de production des machines, ni des résultats d'une enquête.

(6) En ce qui concerne les années antérieures à 1971, les données ne sont pas disponibles sur la base 1971 = 100. Pour obtenir une continuité des données de ces années, les indices sur la base 1961 = 100 furent convertis arithmétiquement à l'année de référence 1971 en les multipliant par 100.0 et en divisant le produit obtenu par la valeur de l'indice de 1971 sur la base de 1961 = 100. On a ajusté les indices de production de l'industrie du caoutchouc et des produits en matière plastique, et des industries manufacturières diverses, basés sur l'indice annuel du produit intérieur réel de façon à connaître la tendance des industries selon la Classification des activités économiques de 1970, pour la période de 1961 à 1970.

Given the many conceptual and measurement problems surrounding the notion of capacity utilization, the utilization rates shown here are indicative of trends and cycles in the utilization of capital. The indicated level is only a statistical approximation and should be viewed as such. For example, a rate of 100% indicates a high level of capital utilization which is considered a peak for the period observed.

Étant donné qu'il existe plusieurs problèmes relatifs à la notion du taux d'utilisation, il conviendrait de noter que les taux d'utilisation publiés ne constituent pas des mesures exactes, mais des statistiques indiquant les tendances et les cycles d'utilisation du stock de capital fixe. Par exemple, un taux de 100% indique un haut niveau de l'utilisation de capital qui est considéré un sommet pendant la période observée.

## HIGHLIGHTS

The utilization rates for the first quarter 1984 appearing in this publication correspond to those released on June 14, 1984 in the Statistics Canada Daily and CANSIM.

The capacity utilization rate in Canadian manufacturing industries remained virtually unchanged from the fourth quarter of 1983. The rate fell of 0.3% to a level of 71.7% from 71.9% in the fourth quarter of 1983. Eleven of the 20 industry groups recorded lower capacity utilization rates, but of these, four had a decrease of less than 1%. The two most important declines were in the wood industries, 10.8%, and the paper and allied industries, 9.2%, both of which can be attributed to labour problems in these industries in British Columbia. The most important gains were 8.4% in the non-metallic minerals products group and 8.0% in the machinery industry group.

Utilization rates in durable manufacturing industries recorded a 1.7% increase in the first quarter of 1984, rising to 67.4% of capacity from 66.3% in the fourth quarter of 1983. This is a continuance of the upward movements which began in the first quarter of 1983 for the durable sector. In the non-durable sector there was a 1.9% decrease to 76.1% from 77.6%.

## FAITS SAILLANTS

Les taux d'utilisation publiés dans ce numéro du premier trimestre de 1984 correspondent à ceux parus dans le Quotidien de Statistique Canada du 14 juin 1984 et dans CANSIM.

L'utilisation de la capacité dans les industries manufacturières canadiennes est demeurée pratiquement inchangée par rapport au quatrième trimestre de 1983. En effet, le taux a chuté de 0.3% pour s'établir à 71.7%, comparativement à 71.9% au quatrième trimestre de 1983. Onze des 20 groupes industriels ont affiché une baisse du taux d'utilisation de la capacité, mais quatre de ceux-ci n'ont subi qu'une baisse inférieure à 1%. Les deux diminutions les plus importantes ont été celle du groupe du bois (10.8%) et celle du groupe des papiers et industries connexes (9.2%); dans les deux cas, les baisses sont attribuables à des problèmes de relations de travail en Colombie-Britannique. Les deux augmentations les plus importantes ont été celle du groupe des produits des minéraux non métalliques (8.4%) et celle du groupe des machines (8.0%).

Les taux d'utilisation dans les industries manufacturières de biens durables ont enregistré une hausse de 1.7% au cours du premier trimestre de 1984, passant de 66.3% au quatrième trimestre de 1983 à 67.4%. Il s'agit là de la poursuite d'un mouvement à la hausse qui a débuté au cours du premier trimestre de 1983 dans le secteur des biens durables. Dans le secteur des biens non durables, il s'est produit une diminution de 1.9%, et le taux s'est établi à 76.1%, comparativement à 77.6% au cours du trimestre précédent.

### Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

### How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 9Z9 (Telephone: 990-9684) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

### How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6.

### Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

### Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et du stock de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 9Z9 (téléphone: 990-9684) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- <sup>r</sup> revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- .. nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- P nombres provisoires.
- <sup>r</sup> nombres rectifiés.
- x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

## INTRODUCTION

From the point of view of utilization of resources available for the production of goods, there is a significant similarity between the labour force and the stock of capital in place. Any degree of under-utilization in either type of resource indicates the gap between potential and actual use of these resources. However, when the socio-political implications of unemployed resources are considered, then the difference between capital stocks and labour becomes substantial.

It is common knowledge that the stock of capital in place typically is not used with the same degree of intensity over the year. Recently, increasing attention has been focused on the measurement of productive potential and the extent to which it is realized. This capacity utilization measurement is an interesting way of examining the relationship between the total resources available and the level of potential output. Within this context, utilization measures could establish significant yardsticks indicative of trends and cycles in capacity utilization.

Economists, particularly in the United States, in their efforts to measure capacity have developed a number of alternative methods varying from direct annual surveys to econometric models.

At present in Canada, the Department of Industry, Trade and Commerce produces an index of capacity utilization for the goods-producing industries by using the Wharton School trend-through-peak estimation procedures.<sup>(1)</sup> This index is derived from seasonally adjusted quarterly indexes of industrial production, which are charted and the peaks selected by inspection. These peaks are considered to be the capacity output of the industry. Successive capacity peaks are joined by a straight line to indicate the capacity during the intervening periods. Forward extrapolation of the same straight line generates capacity measures for periods following the last peak until the actual production index intersects the line.

(1) These indexes are published in **Rate of Capacity Utilization, Canada**. Department of Industry, Trade and Commerce, Ottawa.

Si l'on se place dans la perspective de l'utilisation des ressources disponibles, on constate une certaine similitude entre la main-d'oeuvre occupée et le stock de capital en place. Tout degré de sous-utilisation de l'une ou l'autre de ces ressources indique qu'il existe une différence entre leur utilisation potentielle et réelle. Cependant, si l'on tient compte des implications sociales et politiques de la non-utilisation des ressources disponibles, la différence entre les stocks de capital et la main-d'oeuvre s'accroît.

Il est reconnu que le stock de capital en place n'est pas utilisé dans la même proportion d'une année à l'autre. Depuis quelque temps, on cherche de plus en plus à mesurer d'une façon précise la différence entre le potentiel de productivité et la productivité réelle. Cette mesure de l'utilisation de la capacité peut servir à examiner la relation existant entre l'ensemble des ressources disponibles et le potentiel de production. De plus, une mesure de l'utilisation de la capacité pourrait servir à mesurer les tendances et les cycles à l'intérieur de celle-ci.

Dans le cadre de travaux sur la mesure de la capacité, des économistes, en particulier aux États-Unis, ont mis sur pied un certain nombre d'autres méthodes de quantification allant des enquêtes annuelles directes aux modèles économétriques.

Au Canada, le ministère de l'Industrie et du Commerce produit actuellement un indice de l'utilisation de la capacité pour les industries de biens d'après les méthodes d'estimation de la tendance générale par les sommets de l'école Wharton<sup>(1)</sup>. Cet indice est calculé à partir d'indices trimestriels désaisonnalisés de la production industrielle, qui sont reportés sur un graphique sur lequel on choisit les sommets. On considère que ces sommets représentent la capacité de production de l'industrie. Les différents sommets atteints au cours de chaque trimestre sont reliés par une ligne droite de façon à indiquer la capacité au cours de la période comprise entre deux sommets. Une extrapolation directe de cette même ligne droite permet de mesurer la capacité pour la période comprise entre le dernier sommet jusqu'à l'intersection par l'indice de la production réelle de la ligne droite.

(1) Ces indices sont publiés dans **Taux d'utilisation de la capacité**. Ministère de l'Industrie et du Commerce, Ottawa.

The Statistics Canada approach represents an alternative measure and is based on the capital-output ratio of each industry. It provides a basis for establishing the capacity output series with which actual output data are compared in order to derive the utilization rates. The definition of capacity in this procedure is the maximum output obtainable under "normal" technological and market conditions.

Some differences in level exist between the Statistics Canada series and those of the Department of Industry, Trade and Commerce. This situation is to be expected, of course, given the different estimation procedures underlying each set of measures.

The Statistical Tables show quarterly indexes of capacity utilization in Canadian manufacturing broken down into various major groups according to the 1970 **Standard Industrial Classification**.

The methodology used to produce these indexes is based on a comparison of the **actual** output of an industry during a certain time period with the estimated **capacity** output during that period.(2)

The estimated capacity output is based on a capacity capital-output ratio derived from the industry's gross stock of fixed capital, measured in 1971 dollars. These capital stock estimates are produced by the National Wealth and Capital Stock Section of Statistics Canada, and a brief outline of the method used to derive the estimates follows.(3)

The measurement procedure underlying the capital stock estimates is known as the "perpetual inventory" method. Briefly, this method involves the accumulation, over a period of years, of investment expenditures by industry to obtain its capital stock in any given year. The basic ingredients required are:

Annual investment series in current dollars by industry and category of expenditure;

price deflators relating to the investment-series; and

estimates of the average economic life of the assets used in the various industries.

(2) The concepts of capacity used follows the work of Daniel Creamer, "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, No. 72 National Industrial Conference Board, New York, 1961.

(3) Capital stock estimates are published in **Fixed Capital Flows and Stocks**, Catalogue 13-211, Annual.

L'approche de Statistique Canada est en fait un autre genre de mesure et repose sur le coefficient de capital de chaque industrie. Elle permet d'établir des séries sur la capacité de production que l'on compare aux données sur la production réelle de façon à obtenir les taux d'utilisation. La capacité, d'après cette méthode, se définit comme le maximum de biens que l'on peut produire dans des conditions technologiques et commerciales "normales".

Il existe certaines différences de niveau entre les séries de Statistique Canada et celles du ministère de l'Industrie et du Commerce. Il va sans dire que ces différences proviennent du fait que les méthodes d'estimation de chacun des ensembles de mesures sont différentes.

Les tableaux statistiques présentent des indices trimestriels de l'utilisation de la capacité pour les industries manufacturières du Canada ventilés en principaux groupes selon la **Classification des activités économiques**, de 1970.

La méthodologie inhérente au calcul de ces indices repose sur la comparaison de la production **réelle** d'une industrie au cours d'une certaine période avec la **capacité** estimée de production au cours de cette même période(2).

La capacité de production estimée est calculée d'après le coefficient de capital de capacité obtenu à partir du stock brut de capital fixe de l'industrie, mesuré en dollars de 1971. Ces estimations du stock de capital sont produites par la Section de la richesse nationale et du stock de capital de Statistique Canada. Voici une brève description de la méthode utilisée pour calculer les estimations(3).

La méthode de mesure des estimations de stocks de capital est celle de "l'inventaire perpétuel". En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissement de l'industrie pour obtenir son stock de capital pour une année donnée. Les éléments fondamentaux nécessaires sont:

Les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les différentes industries.

(2) La définition de la capacité utilisée ici est celle qu'a formulée Daniel Creamer dans "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, n° 72, National Industrial Conference Board, New York, 1961.

(3) Des estimations du stock de capital sont publiées dans **Flux et stocks de capital fixe**, n° 13-211 au catalogue, annuel.

To illustrate the mechanics of the "perpetual inventory" method, an example of the actual computing process is given. (Text Table I summarizes the computational procedure involved in this example.) Assume that the capital assets in a particular industry remain in production for 10 years before they are retired. We start with year one and adjusting for prices, we accumulate the investment expenditures pertaining to the types of capital assets in question for a period of 10 years. In the tenth year, a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year, we deduct from the accumulated total the investment expenditures of the first year and add the purchase of capital assets of the eleventh year. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimated. The net stock is equal to the difference between the cumulative value of past gross investment and cumulative depreciation.

The quarterly capital estimates are derived by applying a linear interpolation to the annual capital stocks. The stock estimates are then combined with the seasonally adjusted quarterly production indexes to derive quarterly capital-output ratios for the whole period. The production indexes for the Petroleum and Coal Industry are the gross output rather than the gross domestic product which are used for all other industries. It is felt that the gross output index better reflects the performance of the industry in the light of significant price changes.(4)

(4) The indexes of industrial production used are those published in **Gross Domestic Product by Industry**, Catalogues 61-213, and 61-005, Statistics Canada.

Pour expliquer le mécanisme de "l'inventaire perpétuel", voici un exemple du processus réel du calcul. (Le tableau explicatif I résume le processus du calcul.) Supposons que l'actif immobilisé de l'industrie demeure en production pendant 10 ans avant d'être retiré. On commence par la première année et, après déflation, on accumule les dépenses d'investissement se rapportant aux catégories de capital considérées pour une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs immobilisés de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif et on ajoute les achats d'actifs immobilisés au cours de la onzième année. On procède de la même façon pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs immobilisés à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Le stock net est égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée.

Les estimations trimestrielles de capital sont calculées d'après une interpolation linéaire des stocks annuels de capital. Ces estimations de stocks sont ajustées pour tenir compte des dépenses engagées au titre de la réduction de la pollution et ensuite combinées aux indices trimestriels désaisonnalisés de la production pour donner les coefficients de capital trimestriels pour l'ensemble de la période. L'indice de la production pour l'industrie des dérivés du pétrole et du charbon est l'indice de la production brute au lieu de celui du produit intérieur brut qui est utilisé dans les autres industries. En vue d'importants changements des prix, on croit que l'indice de la production brute soit plus représentatif de la performance de cette industrie(4).

(4) Les indices de la production industrielle utilisés ont été publiés dans **Produit intérieur brut par industrie**, n° 61-213 et 61-005 au catalogue, Statistique Canada.

These ratios are expressed in the Statistical Tables in constant 1971 dollars in order to show the degree of capital intensity in the various industries. The minimum capital-output ratio during this period indicates the historical capacity peak. When we divide the capital stocks series by the minimum capital-output ratio, we obtain a series of potential output.

As the final step in this procedure, actual data for individual production indexes are expressed as a ratio of the potential output series in percentage form to obtain the indexes of capacity utilization.

We summarize the procedure of measuring the capacity and operating rates in the following fashion:

Let  $K_t$  = fixed capital stocks at time  $t$ ,

let  $\frac{K_0}{P_0}$  = capacity capital-output ratio

where  $K_0$  = fixed capital in benchmark period(5)

and  $P_0$  = capacity output in the same period,

let  $P_t$  = actual output at time  $t$ ,

and  $CP_t$  = estimated capacity output at time  $t$ .

Then  $K_t + \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = percentage of capacity utilized at time  $t$ ; that is, the capacity utilization rate.

Of course, in subsequent periods, if a lower capital-output ratio occurs, it is adopted as the capacity ratio, and the entire series is adjusted accordingly.

This formula was used to calculate the manufacturing industry capacity utilization rates shown in the Statistical Tables. The indexes for durable, non-durable and total

Dans les Tableaux statistiques, ces coefficients sont exprimés en dollars constants de 1971 de façon à indiquer le degré d'intensité de capital des différentes industries. Le coefficient de capital minimum au cours de cette période indique le sommet historique de la capacité. Lorsqu'on divise les séries des stocks de capital par le coefficient de capital minimum, on obtient une série de la production potentielle.

Enfin, les données réelles pour les indices de production individuels sont exprimées en tant que ratio des séries de la production potentielle en pourcentage pour obtenir les indices de l'utilisation de la capacité.

Nous pouvons résumer ainsi la marche à suivre pour la mesure des taux d'utilisation de la capacité et d'activité:

Soit  $K_t$  = stocks de capital au temps  $t$ ,

et soit  $\frac{K_0}{P_0}$  = coefficient de capital de la capacité

où  $K_0$  = capital fixe au cours de la période repère(5)

et  $P_0$  = production potentielle au cours de la même période,

soit  $P_t$  = production réelle au temps  $t$ ,

et  $CP_t$  = production potentielle prévue au temps  $t$ .

Alors  $K_t + \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = pourcentage de la capacité utilisée au temps  $t$ ; c'est-à-dire le taux d'utilisation de la capacité.

Bien entendu, lorsque l'on enregistre un coefficient de capital plus bas, au cours des périodes qui suivent, on le considère comme étant le ratio de capacité, et toute la série est ajustée en conséquence.

Cette formule a été utilisée pour calculer les taux de l'utilisation de la capacité des industries manufacturières présentés dans les Tableaux statistiques. Les indices ont été calculés par

(5) As noted previously, this benchmark period is the time when the minimum capital-output ratio occurred.

(5) Comme il a été mentionné auparavant, cette période repère est le moment où l'on a enregistré le plus bas coefficient capital-production.

TEXT TABLE I. Example: Assumed Service Life = 10 Years = L

manufacturing were derived by aggregation, using the same weights as the 1971 Gross Domestic Product.(6)

The statistics presented here are only statistical estimates and they are not operating ratios based on either engineering measures, such as productive machine hours, or survey results.

(6) For the period prior to 1971 the data are not available on a 1971 base. To obtain a continuous record on a 1971 base, the indexes on a 1961 base were mechanically rebased to 1971 by multiplying by 100.0 and dividing by the 1971 index value on a 1961 base. An adjustment has been made to the production indexes for Rubber and Plastics Products, and Miscellaneous Manufacturing, based on the annual Real Domestic Product Indexes, to capture the trend of the individual industries according to the 1970 Standard Industrial Classification, from 1961 to 1970.

agrégation tant pour l'ensemble des industries manufacturières que pour les industries des biens durables et non durables à partir des mêmes pondérations que celles pour du produit intérieur brut de 1971(6).

Ces chiffres représentent uniquement des approximations et ne sont pas des coefficients de fonctionnement basés sur des mesures industrielles, comme les heures de production des machines, ni des résultats d'une enquête.

(6) En ce qui concerne les années antérieures à 1971, les données ne sont pas disponibles sur la base 1971 = 100. Pour obtenir une continuité des données de ces années, les indices sur la base 1961 = 100 furent convertis arithmétiquement à l'année de référence 1971 en les multipliant par 100.0 et en divisant le produit obtenu par la valeur de l'indice de 1971 sur la base de 1961 = 100. On a ajusté les indices de production de l'industrie du caoutchouc et des produits en matière plastique, et des industries manufacturières diverses, basés sur l'indice annuel du produit intérieur réel de façon à connaître la tendance des industries selon la Classification des activités économiques de 1970, pour la période de 1961 à 1970.

Given the many conceptual and measurement problems surrounding the notion of capacity utilization, the utilization rates shown here are indicative of trends and cycles in the utilization of capital. The indicated level is only a statistical approximation and should be viewed as such. For example, a rate of 100% indicates a high level of capital utilization which is considered a peak for the period observed.

Étant donné qu'il existe plusieurs problèmes relatifs à la notion du taux d'utilisation, il conviendrait de noter que les taux d'utilisation publiés ne constituent pas des mesures exactes, mais des statistiques indiquant les tendances et les cycles d'utilisation du stock de capital fixe. Par exemple, un taux de 100% indique un haut niveau de l'utilisation de capital qui est considéré un sommet pendant la période observée.

	Miscellaneous manufacturing - Industries diverses	0.654	544.4

## HIGHLIGHTS

The utilization rates for the second quarter 1984 appearing in this publication correspond to those released on September 6, 1984 in the Statistics Canada Daily and CANSIM.

Capacity utilization in Canadian manufacturing industries remained relatively unchanged in the second quarter of 1984, edging up 0.3% to a level of 72.3% from 72.1% in the first quarter of 1984.

In the latest quarter, higher capacity utilization rates were posted in 14 of the 20 industry groups but 10 of these industries recorded gains of less than 4%. These increases were almost completely offset by decreases in transportation equipment (- 11.0%), tobacco products (- 8.2%), electrical products (- 6.5%) and furniture and fixtures (- 6.3%). The most important gains registered in capacity utilization rates in the second quarter were 7.4% in the clothing industry, 7.4% in paper and allied products, 7.1% in wood, and 6.2% in machinery.

Utilization rates in durable manufacturing industries decreased 2.2% in the second quarter of 1984 to 65.5% of capacity from 67.0% in the first quarter of 1984. In the non-durable sector, capacity utilization increased 2.5% to 79.3% from 77.4%.

## FAITS SAILLANTS

Les taux d'utilisation publiés dans ce numéro du deuxième trimestre de 1984 correspondent à ceux parus dans le Quotidien de Statistique Canada du 6 septembre 1984 et dans CANSIM.

L'utilisation de la capacité dans les industries manufacturières canadiennes est demeurée pratiquement inchangée au cours du deuxième trimestre de 1984, gagnant 0.3% pour s'établir à 72.3%, comparativement à 72.1% au trimestre précédent.

On observe une augmentation d'utilisation de la capacité dans 14 des 20 groupes industriels, 10 de ces 14 groupes ont, cependant, affiché des progressions inférieures à 4%. De plus, des baisses dans les groupes du matériel de transport (- 11%), des produits du tabac (- 8.2%), des produits électriques (- 6.5%) et des meubles et articles d'ameublement (- 6.3%) ont presque complètement neutralisé ces augmentations. C'est dans les groupes de l'habillement et du papier et activités connexes (7.4% chacun), du bois (7.1%) et des machines (6.2%) que les taux d'utilisation de la capacité ont augmenté le plus au cours du deuxième trimestre.

Les taux d'utilisation dans les industries manufacturières de biens durables ont diminué de 2.2% pour se fixer à 65.5% de la capacité au deuxième trimestre de 1984, comparativement à 67.0% au premier trimestre. Dans le secteur des biens non durables, le taux d'utilisation de la capacité s'est accru de 2.5% pour s'établir à 79.3%, contre 77.4% au cours du trimestre précédent.

## LIST OF RELATED PUBLICATIONS

### Catalogue

#### Occasional

- 13-522 Fixed Capital Flows and Stocks, Manufacturing, Canada, 1926-1960. Methodology, 1967. English.
- 13-568 Fixed Capital Flows and Stocks, historical. Bilingual.

#### Annual

- 13-211 Fixed Capital Flows and Stocks. Bilingual.
- 61-205 Private and Public Investment in Canada, Outlook. Bilingual.
- 61-206 Private and Public Investment in Canada, Mid-year Review. Bilingual.
- 61-213 Gross Domestic Product by Industry. Bilingual.

#### Monthly

- 61-005 Gross Domestic Product by Industry. Bilingual.

In addition to the selected publications listed above, Statistics Canada publishes a wide range of statistical reports on Canadian economic and social affairs. A comprehensive catalogue of all current publications is available free on request from Statistics Canada, Ottawa, K1A 0T6.

## LISTE DES PUBLICATIONS CONNEXES

### Catalogue

#### Hors Série

- 13-522 Fixed Capital Flows and Stocks, Manufacturing, Canada, 1926-1960 Methodology, 1967. Anglais.
- 13-568 Flux et stocks de capital fixe, historique. Bilingue.

#### Annuel

- 13-211 Flux et stocks de capital fixe. Bilingue.
- 61-205 Investissements privés et publics au Canada, Perspectives. Bilingue.
- 61-206 Investissements privés et publics au Canada, Revue de la mi-année. Bilingue.
- 61-213 Produit intérieur brut par industrie. Bilingue.

#### Mensuel

- 61-005 Produit intérieur brut par industries. Bilingue.

Outre les publications ci-dessus énumérées, Statistique Canada publie une grande variété de rapports statistiques sur le Canada tant dans le domaine économique que social. On peut se procurer gratuitement un catalogue complet des publications courantes à Statistique Canada, Ottawa, K1A 0T6.

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 9Z9 (Telephone: 990-9684) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831
Ontario	1-800-268-1151
Manitoba	1-800-282-8006
Saskatchewan	1(112)800-667-3524
Alberta	1-800-222-6400
British Columbia (South and Central)	112-800-663-1551
Yukon and Northern B.C. (area served by NorthwesTel Inc.)	Zenith 0-8913

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et du stock de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 9Z9 (téléphone: 990-9684) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- .. nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- P nombres provisoires.
- r nombres rectifiés.
- x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

## INTRODUCTION

From the point of view of utilization of resources available for the production of goods, there is a significant similarity between the labour force and the stock of capital in place. Any degree of under-utilization in either type of resource indicates the gap between potential and actual use of these resources. However, when the socio-political implications of unemployed resources are considered, then the difference between capital stocks and labour becomes substantial.

It is common knowledge that the stock of capital in place typically is not used with the same degree of intensity over the year. Recently, increasing attention has been focused on the measurement of productive potential and the extent to which it is realized. This capacity utilization measurement is an interesting way of examining the relationship between the total resources available and the level of potential output. Within this context, utilization measures could establish significant yardsticks indicative of trends and cycles in capacity utilization.

Economists, particularly in the United States, in their efforts to measure capacity have developed a number of alternative methods varying from direct annual surveys to econometric models.

At present in Canada, the Department of Industry, Trade and Commerce produces an index of capacity utilization for the goods-producing industries by using the Wharton School trend-through-peak estimation procedures.<sup>(1)</sup> This index is derived from seasonally adjusted quarterly indexes of industrial production, which are charted and the peaks selected by inspection. These peaks are considered to be the capacity output of the industry. Successive capacity peaks are joined by a straight line to indicate the capacity during the intervening periods. Forward extrapolation of the same straight line generates capacity measures for periods following the last peak until the actual production index intersects the line.

(1) These indexes are published in **Rate of Capacity Utilization, Canada**. Department of Industry, Trade and Commerce, Ottawa.

Si l'on se place dans la perspective de l'utilisation des ressources disponibles, on constate une certaine similitude entre la main-d'oeuvre occupée et le stock de capital en place. Tout degré de sous-utilisation de l'une ou l'autre de ces ressources indique qu'il existe une différence entre leur utilisation potentielle et réelle. Cependant, si l'on tient compte des implications sociales et politiques de la non-utilisation des ressources disponibles, la différence entre les stocks de capital et la main-d'oeuvre s'accroît.

Il est reconnu que le stock de capital en place n'est pas utilisé dans la même proportion d'une année à l'autre. Depuis quelque temps, on cherche de plus en plus à mesurer d'une façon précise la différence entre le potentiel de productivité et la productivité réelle. Cette mesure de l'utilisation de la capacité peut servir à examiner la relation existant entre l'ensemble des ressources disponibles et le potentiel de production. De plus, une mesure de l'utilisation de la capacité pourrait servir à mesurer les tendances et les cycles à l'intérieur de celle-ci.

Dans le cadre de travaux sur la mesure de la capacité, des économistes, en particulier aux États-Unis, ont mis sur pied un certain nombre d'autres méthodes de quantification allant des enquêtes annuelles directes aux modèles économétriques.

Au Canada, le ministère de l'Industrie et du Commerce produit actuellement un indice de l'utilisation de la capacité pour les industries de biens d'après les méthodes d'estimation de la tendance générale par les sommets de l'école Wharton<sup>(1)</sup>. Cet indice est calculé à partir d'indices trimestriels désaisonnalisés de la production industrielle, qui sont reportés sur un graphique sur lequel on choisit les sommets. On considère que ces sommets représentent la capacité de production de l'industrie. Les différents sommets atteints au cours de chaque trimestre sont reliés par une ligne droite de façon à indiquer la capacité au cours de la période comprise entre deux sommets. Une extrapolation directe de cette même ligne droite permet de mesurer la capacité pour la période comprise entre le dernier sommet jusqu'à l'intersection par l'indice de la production réelle de la ligne droite.

(1) Ces indices sont publiés dans **Taux d'utilisation de la capacité**. Ministère de l'Industrie et du Commerce, Ottawa.

The Statistics Canada approach represents an alternative measure and is based on the capital-output ratio of each industry. It provides a basis for establishing the capacity output series with which actual output data are compared in order to derive the utilization rates. The definition of capacity in this procedure is the maximum output obtainable under "normal" technological and market conditions.

Some differences in level exist between the Statistics Canada series and those of the Department of Industry, Trade and Commerce. This situation is to be expected, of course, given the different estimation procedures underlying each set of measures.

The Statistical Tables show quarterly indexes of capacity utilization in Canadian manufacturing broken down into various major groups according to the 1970 **Standard Industrial Classification**.

The methodology used to produce these indexes is based on a comparison of the **actual** output of an industry during a certain time period with the estimated **capacity** output during that period.(2)

The estimated capacity output is based on a capacity capital-output ratio derived from the industry's gross stock of fixed capital, measured in 1971 dollars. These capital stock estimates are produced by the National Wealth and Capital Stock Section of Statistics Canada, and a brief outline of the method used to derive the estimates follows.(3)

The measurement procedure underlying the capital stock estimates is known as the "perpetual inventory" method. Briefly, this method involves the accumulation, over a period of years, of investment expenditures by industry to obtain its capital stock in any given year. The basic ingredients required are:

Annual investment series in current dollars by industry and category of expenditure;

price deflators relating to the investment-series; and

estimates of the average economic life of the assets used in the various industries.

(2) The concepts of capacity used follows the work of Daniel Creamer, "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, No. 72 National Industrial Conference Board, New York, 1961.

(3) Capital stock estimates are published in **Fixed Capital Flows and Stocks**, Catalogue 13-211, Annual.

L'approche de Statistique Canada est en fait un autre genre de mesure et repose sur le coefficient de capital de chaque industrie. Elle permet d'établir des séries sur la capacité de production que l'on compare aux données sur la production réelle de façon à obtenir les taux d'utilisation. La capacité, d'après cette méthode, se définit comme le maximum de biens que l'on peut produire dans des conditions technologiques et commerciales "normales".

Il existe certaines différences de niveau entre les séries de Statistique Canada et celles du ministère de l'Industrie et du Commerce. Il va sans dire que ces différences proviennent du fait que les méthodes d'estimation de chacun des ensembles de mesures sont différentes.

Les tableaux statistiques présentent des indices trimestriels de l'utilisation de la capacité pour les industries manufacturières du Canada ventilés en principaux groupes selon la **Classification des activités économiques**, de 1970.

La méthodologie inhérente au calcul de ces indices repose sur la comparaison de la production **réelle** d'une industrie au cours d'une certaine période avec la **capacité** estimée de production au cours de cette même période(2).

La capacité de production estimée est calculée d'après le coefficient de capital de capacité obtenu à partir du stock brut de capital fixe de l'industrie, mesuré en dollars de 1971. Ces estimations du stock de capital sont produites par la Section de la richesse nationale et du stock de capital de Statistique Canada. Voici une brève description de la méthode utilisée pour calculer les estimations(3).

La méthode de mesure des estimations de stocks de capital est celle de "l'inventaire perpétuel". En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissement de l'industrie pour obtenir son stock de capital pour une année donnée. Les éléments fondamentaux nécessaires sont:

Les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les différentes industries.

(2) La définition de la capacité utilisée ici est celle qu'a formulée Daniel Creamer dans "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, n° 72, National Industrial Conference Board, New York, 1961.

(3) Des estimations du stock de capital sont publiées dans **Flux et stocks de capital fixe**, n° 13-211 au catalogue, annuel.

To illustrate the mechanics of the "perpetual inventory" method, an example of the actual computing process is given. (Text Table I summarizes the computational procedure involved in this example.) Assume that the capital assets in a particular industry remain in production for 10 years before they are retired. We start with year one and adjusting for prices, we accumulate the investment expenditures pertaining to the types of capital assets in question for a period of 10 years. In the tenth year, a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year, we deduct from the accumulated total the investment expenditures of the first year and add the purchase of capital assets of the eleventh year. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimated. The net stock is equal to the difference between the cumulative value of past gross investment and cumulative depreciation.

The quarterly capital estimates are derived by applying a linear interpolation to the annual capital stocks. The stock estimates are then combined with the seasonally adjusted quarterly production indexes to derive quarterly capital-output ratios for the whole period. The production indexes for the Petroleum and Coal Industry are the gross output rather than the gross domestic product which are used for all other industries. It is felt that the gross output index better reflects the performance of the industry in the light of significant price changes.(4)

(4) The indexes of industrial production used are those published in **Gross Domestic Product by Industry**, Catalogues 61-213, and 61-005, Statistics Canada.

Pour expliquer le mécanisme de "l'inventaire perpétuel", voici un exemple du processus réel du calcul. (Le tableau explicatif I résume le processus du calcul.) Supposons que l'actif immobilisé de l'industrie demeure en production pendant 10 ans avant d'être retiré. On commence par la première année et, après déflation, on accumule les dépenses d'investissement se rapportant aux catégories de capital considérées pour une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs immobilisés de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif et on ajoute les achats d'actifs immobilisés au cours de la onzième année. On procède de la même façon pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs immobilisés à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Le stock net est égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée.

Les estimations trimestrielles de capital sont calculées d'après une interpolation linéaire des stocks annuels de capital. Ces estimations de stocks sont ajustées pour tenir compte des dépenses engagées au titre de la réduction de la pollution et ensuite combinées aux indices trimestriels désaisonnalisés de la production pour donner les coefficients de capital trimestriels pour l'ensemble de la période. L'indice de la production pour l'industrie des dérivés du pétrole et du charbon est l'indice de la production brute au lieu de celui du produit intérieur brut qui est utilisé dans les autres industries. En vue d'importants changements des prix, on croit que l'indice de la production brute soit plus représentatif de la performance de cette industrie(4).

(4) Les indices de la production industrielle utilisés ont été publiés dans **Produit intérieur brut par industrie**, n° 61-213 et 61-005 au catalogue, Statistique Canada.

These ratios are expressed in the Statistical Tables in constant 1971 dollars in order to show the degree of capital intensity in the various industries. The minimum capital-output ratio during this period indicates the historical capacity peak. When we divide the capital stocks series by the minimum capital-output ratio, we obtain a series of potential output.

As the final step in this procedure, actual data for individual production indexes are expressed as a ratio of the potential output series in percentage form to obtain the indexes of capacity utilization.

We summarize the procedure of measuring the capacity and operating rates in the following fashion:

Let  $K_t$  = fixed capital stocks at time  $t$ ,

let  $\frac{K_0}{P_0}$  = capacity capital-output ratio

where  $K_0$  = fixed capital in benchmark period(5)

and  $P_0$  = capacity output in the same period,

let  $P_t$  = actual output at time  $t$ ,

and  $CP_t$  = estimated capacity output at time  $t$ .

Then  $K_t + \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = percentage of capacity utilized at time  $t$ ; that is, the capacity utilization rate.

Of course, in subsequent periods, if a lower capital-output ratio occurs, it is adopted as the capacity ratio, and the entire series is adjusted accordingly.

This formula was used to calculate the manufacturing industry capacity utilization rates shown in the Statistical Tables. The indexes for durable, non-durable and total

Dans les Tableaux statistiques, ces coefficients sont exprimés en dollars constants de 1971 de façon à indiquer le degré d'intensité de capital des différentes industries. Le coefficient de capital minimum au cours de cette période indique le sommet historique de la capacité. Lorsqu'on divise les séries des stocks de capital par le coefficient de capital minimum, on obtient une série de la production potentielle.

Enfin, les données réelles pour les indices de production individuels sont exprimées en tant que ratio des séries de la production potentielle en pourcentage pour obtenir les indices de l'utilisation de la capacité.

Nous pouvons résumer ainsi la marche à suivre pour la mesure des taux d'utilisation de la capacité et d'activité:

Soit  $K_t$  = stocks de capital au temps  $t$ ,

et soit  $\frac{K_0}{P_0}$  = coefficient de capital de la capacité

où  $K_0$  = capital fixe au cours de la période repère(5)

et  $P_0$  = production potentielle au cours de la même période,

soit  $P_t$  = production réelle au temps  $t$ ,

et  $CP_t$  = production potentielle prévue au temps  $t$ .

Alors  $K_t + \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = pourcentage de la capacité utilisée au temps  $t$ ; c'est-à-dire le taux d'utilisation de la capacité.

Bien entendu, lorsque l'on enregistre un coefficient de capital plus bas, au cours des périodes qui suivent, on le considère comme étant le ratio de capacité, et toute la série est ajustée en conséquence.

Cette formule a été utilisée pour calculer les taux de l'utilisation de la capacité des industries manufacturières présentés dans les Tableaux statistiques. Les indices ont été calculés par

(5) As noted previously, this benchmark period is the time when the minimum capital-output ratio occurred.

(5) Comme il a été mentionné auparavant, cette période repère est le moment où l'on a enregistré le plus bas coefficient capital-production.

manufacturing were derived by aggregation, using the same weights as the 1971 Gross Domestic Product.(6)

The statistics presented here are only statistical estimates and they are not operating ratios based on either engineering measures, such as productive machine hours, or survey results.

(6) For the period prior to 1971 the data are not available on a 1971 base. To obtain a continuous record on a 1971 base, the indexes on a 1961 base were mechanically rebased to 1971 by multiplying by 100.0 and dividing by the 1971 index value on a 1961 base. An adjustment has been made to the production indexes for Rubber and Plastics Products, and Miscellaneous Manufacturing, based on the annual Real Domestic Product Indexes, to capture the trend of the individual industries according to the 1970 Standard Industrial Classification, from 1961 to 1970.

agrégation tant pour l'ensemble des industries manufacturières que pour les industries des biens durables et non durables à partir des mêmes pondérations que celles pour du produit intérieur brut de 1971(6).

Ces chiffres représentent uniquement des approximations et ne sont pas des coefficients de fonctionnement basés sur des mesures industrielles, comme les heures de production des machines, ni des résultats d'une enquête.

(6) En ce qui concerne les années antérieures à 1971, les données ne sont pas disponibles sur la base 1971 = 100. Pour obtenir une continuité des données de ces années, les indices sur la base 1961 = 100 furent convertis arithmétiquement à l'année de référence 1971 en les multipliant par 100.0 et en divisant le produit obtenu par la valeur de l'indice de 1971 sur la base de 1961 = 100. On a ajusté les indices de production de l'industrie du caoutchouc et des produits en matière plastique, et des industries manufacturières diverses, basés sur l'indice annuel du produit intérieur réel de façon à connaître la tendance des industries selon la Classification des activités économiques de 1970, pour la période de 1961 à 1970.

Given the many conceptual and measurement problems surrounding the notion of capacity utilization, the utilization rates shown here are indicative of trends and cycles in the utilization of capital. The indicated level is only a statistical approximation and should be viewed as such. For example, a rate of 100% indicates a high level of capital utilization which is considered a peak for the period observed.

Étant donné qu'il existe plusieurs problèmes relatifs à la notion du taux d'utilisation, il conviendrait de noter que les taux d'utilisation publiés ne constituent pas des mesures exactes, mais des statistiques indiquant les tendances et les cycles d'utilisation du stock de capital fixe. Par exemple, un taux de 100% indique un haut niveau de l'utilisation de capital qui est considéré un sommet pendant la période observée.

	Miscellaneous manufacturing - Industries diverses	0.654	544.4

## HIGHLIGHTS

The utilization rates for the third quarter 1984 appearing in this publication correspond to those released on December 6, 1984 in the Statistics Canada Daily and CANSIM.

Capacity utilization in Canadian manufacturing industries reached 74.2% in the third quarter of 1984, a 2.3% rise from the second quarter level of 72.5%. This gain is due to increases in the following export goods producing industries: transportation equipment (10.8%), machinery (10.4%) and paper and allied industries (6.3%). By contrast the major decreases were noted in industries whose production is mainly for domestic markets: petroleum and coal products decreased by 5.5%, leather by 5.4%, clothing by 2.4% and furniture and fixtures by 2.0%.

Utilization rates in durable manufacturing industries recorded a 5.0% increase in the third quarter of 1984, rising to 69.2% of capacity from 65.9% in the second quarter. In the non-durable sector there was a decrease of 0.1% to 79.2% from 79.3%.

## FAITS SAILLANTS

Les taux d'utilisation publiés dans ce numéro du troisième trimestre de 1984 correspondent à ceux parus dans le Quotidien de Statistique Canada du 6 décembre 1984 et dans CANSIM.

L'utilisation de la capacité dans les industries manufacturières canadiennes a augmenté de 2.3% au cours du troisième trimestre de 1984, pour atteindre 74.2% comparativement à 72.5% au trimestre précédent. Cette progression est imputable à des augmentations de la capacité des branches d'activités productrices de biens d'exportation, soit le matériel de transport (10.8%), les machines (10.4%), le papier et les industries connexes (6.3%). Les diminutions les plus importantes ont été observées dans le cas de branches produisant des biens destinés surtout au marché intérieur: dérivés du pétrole et charbon (5.5%), cuir (5.4%), vêtements (2.4%) et meubles et accessoires (2.0%).

Les taux d'utilisation des industries manufacturières de biens durables ont enregistré une hausse de 5.0% passant de 65.9% au deuxième trimestre de 1984 à 69.2% au trimestre observé. Dans le secteur des biens non durables, il s'est produit une diminution de 0.1%, le taux s'étant établi à 79.2% comparativement à 79.3% au cours du trimestre précédent.

(1) The capital stock series has been adjusted to reflect premature plant closures.

(1) Les données sur le stock de capital ont été rajustées de façon à tenir compte des fermetures prématurées d'usines.

(1) The capital stock series has been adjusted to reflect premature plant closures.

(1) Les données sur le stock de capital ont été rajustées de façon à tenir compte des fermetures prématurées d'usines.

## LIST OF RELATED PUBLICATIONS

### Catalogue

#### Occasional

- 13-522 Fixed Capital Flows and Stocks, Manufacturing, Canada, 1926-1960. Methodology, 1967. English.
- 13-568 Fixed Capital Flows and Stocks, historical. Bilingual.

#### Annual

- 13-211 Fixed Capital Flows and Stocks. Bilingual.
- 61-205 Private and Public Investment in Canada, Outlook. Bilingual.
- 61-206 Private and Public Investment in Canada, Mid-year Review. Bilingual.
- 61-213 Gross Domestic Product by Industry. Bilingual.

#### Monthly

- 61-005 Gross Domestic Product by Industry. Bilingual.

In addition to the selected publications listed above, Statistics Canada publishes a wide range of statistical reports on Canadian economic and social affairs. A comprehensive catalogue of all current publications is available free on request from Statistics Canada, Ottawa, K1A 0T6.

## LISTE DES PUBLICATIONS CONNEXES

### Catalogue

#### Hors Série

- 13-522 Fixed Capital Flows and Stocks, Manufacturing, Canada, 1926-1960 Methodology, 1967. Anglais.
- 13-568 Flux et stocks de capital fixe, historique. Bilingue.

#### Annuel

- 13-211 Flux et stocks de capital fixe. Bilingue.
- 61-205 Investissements privés et publics au Canada, Perspectives. Bilingue.
- 61-206 Investissements privés et publics au Canada, Revue de la mi-année. Bilingue.
- 61-213 Produit intérieur brut par industrie. Bilingue.

#### Mensuel

- 61-005 Produit intérieur brut par industries. Bilingue.

Outre les publications ci-dessus énumérées, Statistique Canada publie une grande variété de rapports statistiques sur le Canada tant dans le domaine économique que social. On peut se procurer gratuitement un catalogue complet des publications courantes à Statistique Canada, Ottawa, K1A 0T6.

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 9Z9 (Telephone: 995-8152) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, **for users who reside outside the local dialing area** of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831
Ontario	1-800-268-1151
Manitoba	1-800-282-8006
Saskatchewan	1(112)800-667-3524
Alberta	1-800-222-6400
British Columbia (South and Central)	112-800-663-1551
Yukon and Northern B.C. (area served by NorthwTel Inc.)	Zenith 0-8913
Northwest Territories (area served by NorthwTel Inc.)	Zenith 2-2015

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et du stock de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 9Z9 (téléphone: 995-8152) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux **utilisateurs qui habitent à l'extérieur des zones de communication locale** des centres régionaux de consultation.

Terre-Neuve et Labrador	Zénith 0-7037

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- R revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- .. nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- P nombres provisoires.
- R nombres rectifiés.
- x confidentiel en vertu des dispositions de la loi sur la statistique relatives au secret.

## INTRODUCTION

From the point of view of utilization of resources available for the production of goods, there is a significant similarity between the labour force and the stock of capital in place. Any degree of under-utilization in either type of resource indicates the gap between potential and actual use of these resources. However, when the socio-political implications of unemployed resources are considered, then the difference between capital stocks and labour becomes substantial.

It is common knowledge that the stock of capital in place typically is not used with the same degree of intensity over the year. Recently, increasing attention has been focused on the measurement of productive potential and the extent to which it is realized. This capacity utilization measurement is an interesting way of examining the relationship between the total resources available and the level of potential output. Within this context, utilization measures could establish significant yardsticks indicative of trends and cycles in capacity utilization.

Economists, particularly in the United States, in their efforts to measure capacity have developed a number of alternative methods varying from direct annual surveys to econometric models.

At present in Canada, the Department of Industry, Trade and Commerce produces an index of capacity utilization for the goods-producing industries by using the Wharton School trend-through-peak estimation procedures.<sup>(1)</sup> This index is derived from seasonally adjusted quarterly indexes of industrial production, which are charted and the peaks selected by inspection. These peaks are considered to be the capacity output of the industry. Successive capacity peaks are joined by a straight line to indicate the capacity during the intervening periods. Forward extrapolation of the same straight line generates capacity measures for periods following the last peak until the actual production index intersects the line.

<sup>(1)</sup> These indexes are published in **Rate of Capacity Utilization, Canada**. Department of Industry, Trade and Commerce, Ottawa.

Si l'on se place dans la perspective de l'utilisation des ressources disponibles, on constate une certaine similitude entre la main-d'oeuvre occupée et le stock de capital en place. Tout degré de sous-utilisation de l'une ou l'autre de ces ressources indique qu'il existe une différence entre leur utilisation potentielle et réelle. Cependant, si l'on tient compte des implications sociales et politiques de la non-utilisation des ressources disponibles, la différence entre les stocks de capital et la main-d'oeuvre s'accroît.

Il est reconnu que le stock de capital en place n'est pas utilisé dans la même proportion d'une année à l'autre. Depuis quelque temps, on cherche de plus en plus à mesurer d'une façon précise la différence entre le potentiel de productivité et la productivité réelle. Cette mesure de l'utilisation de la capacité peut servir à examiner la relation existant entre l'ensemble des ressources disponibles et le potentiel de production. De plus, une mesure de l'utilisation de la capacité pourrait servir à mesurer les tendances et les cycles à l'intérieur de celle-ci.

Dans le cadre de travaux sur la mesure de la capacité, des économistes, en particulier aux États-Unis, ont mis sur pied un certain nombre d'autres méthodes de quantification allant des enquêtes annuelles directes aux modèles économétriques.

Au Canada, le ministère de l'Industrie et du Commerce produit actuellement un indice de l'utilisation de la capacité pour les industries de biens d'après les méthodes d'estimation de la tendance générale par les sommets de l'école Wharton<sup>(1)</sup>. Cet indice est calculé à partir d'indices trimestriels désaisonnalisés de la production industrielle, qui sont reportés sur un graphique sur lequel on choisit les sommets. On considère que ces sommets représentent la capacité de production de l'industrie. Les différents sommets atteints au cours de chaque trimestre sont reliés par une ligne droite de façon à indiquer la capacité au cours de la période comprise entre deux sommets. Une extrapolation directe de cette même ligne droite permet de mesurer la capacité pour la période comprise entre le dernier sommet jusqu'à l'intersection par l'indice de la production réelle de la ligne droite.

<sup>(1)</sup> Ces indices sont publiés dans **Taux d'utilisation de la capacité**. Ministère de l'Industrie et du Commerce, Ottawa.

The Statistics Canada approach represents an alternative measure and is based on the capital-output ratio of each industry. It provides a basis for establishing the capacity output series with which actual output data are compared in order to derive the utilization rates. The definition of capacity in this procedure is the maximum output obtainable under "normal" technological and market conditions.

Some differences in level exist between the Statistics Canada series and those of the Department of Industry, Trade and Commerce. This situation is to be expected, of course, given the different estimation procedures underlying each set of measures.

The Statistical Tables show quarterly indexes of capacity utilization in Canadian manufacturing broken down into various major groups according to the 1970 **Standard Industrial Classification**.

The methodology used to produce these indexes is based on a comparison of the **actual** output of an industry during a certain time period with the estimated **capacity** output during that period.(2)

The estimated capacity output is based on a capacity capital-output ratio derived from the industry's gross stock of fixed capital, measured in 1971 dollars. These capital stock estimates are produced by the National Wealth and Capital Stock Section of Statistics Canada, and a brief outline of the method used to derive the estimates follows.(3) The capital stock figures used here have been adjusted to reflect decreases in efficiency of older capital due to technical obsolescence, and consolidations of operations by industries. While these changes have affected the general level of the rates, they have not altered, to any significant degree the trends reflected in the rates.

The measurement procedure underlying the capital stock estimates is known as the "perpetual inventory" method. Briefly, this method involves the accumulation, over a period of years, of investment expenditures by industry to obtain its capital stock in any given year. The basic ingredients required are:

- (2) The concepts of capacity used follows the work of Daniel Creamer, "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, No. 72 National Industrial Conference Board, New York, 1961.
- (3) Capital stock estimates are published in **Fixed Capital Flows and Stocks**, Catalogue 13-211, Annual.

L'approche de Statistique Canada est en fait un autre genre de mesure et repose sur le coefficient de capital de chaque industrie. Elle permet d'établir des séries sur la capacité de production que l'on compare aux données sur la production réelle de façon à obtenir les taux d'utilisation. La capacité, d'après cette méthode, se définit comme le maximum de biens que l'on peut produire dans des conditions technologiques et commerciales "normales".

Il existe certaines différences de niveau entre les séries de Statistique Canada et celles du ministère de l'Industrie et du Commerce. Il va sans dire que ces différences proviennent du fait que les méthodes d'estimation de chacun des ensembles de mesures sont différentes.

Les tableaux statistiques présentent des indices trimestriels de l'utilisation de la capacité pour les industries manufacturières du Canada ventilés en principaux groupes selon la **Classification des activités économiques**, de 1970.

La méthodologie inhérente au calcul de ces indices repose sur la comparaison de la production **réelle** d'une industrie au cours d'une certaine période avec la **capacité** estimée de production au cours de cette même période(2).

La capacité de production estimée est calculée d'après le coefficient de capital de capacité obtenu à partir du stock brut de capital fixe de l'industrie, mesuré en dollars de 1971. Ces estimations du stock de capital sont produites par la Section de la richesse nationale et du stock de capital de Statistique Canada. Voici une brève description de la méthode utilisée pour calculer les estimations(3). Les chiffres sur le stock de capital utilisés ici ont été corrigés pour tenir compte de l'efficacité décroissante du capital ancien attribuable à l'obsolescence technique, et à la consolidation des opérations par les industries. Ces corrections ont affecté le niveau général des taux, mais elles n'ont pas modifié de façon importante les tendances reflétées par ces taux.

La méthode de mesure des estimations de stocks de capital est celle de "l'inventaire perpétuel". En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissement de l'industrie pour obtenir son stock de capital pour une année donnée. Les éléments fondamentaux nécessaires sont:

- (2) La définition de la capacité utilisée ici est celle qu'a formulée Daniel Creamer dans "Capital Expansion and Capacity in Post-War Manufacturing", Studies in Business Economics, n° 72, National Industrial Conference Board, New York, 1961.
- (3) Des estimations du stock de capital sont publiées dans **Flux et stocks de capital fixe**, n° 13-211 au catalogue, annuel.

Annual investment series in current dollars by industry and category of expenditure;

price deflators relating to the investment-series; and

estimates of the average economic life of the assets used in the various industries.

To illustrate the mechanics of the "perpetual inventory" method, an example of the actual computing process is given. (Text Table I summarizes the computational procedure involved in this example.) Assume that the capital assets in a particular industry remain in production for 10 years before they are retired. We start with year one and adjusting for prices, we accumulate the investment expenditures pertaining to the types of capital assets in question for a period of 10 years. In the tenth year, a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year, we deduct from the accumulated total the investment expenditures of the first year and add the purchase of capital assets of the eleventh year. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimated. The net stock is equal to the difference between the cumulative value of past gross investment and cumulative depreciation.

The quarterly capital estimates are derived by applying a linear interpolation to the annual capital stocks. The stock estimates are then combined with the seasonally adjusted quarterly production indexes to derive quarterly capital-output ratios for the whole period. The production indexes for the Petroleum and Coal Industry are the gross output rather than the gross domestic product which are used for all other industries. It is felt that the gross output

Les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les différentes industries.

Pour expliquer le mécanisme de "l'inventaire perpétuel", voici un exemple du processus réel du calcul. (Le tableau explicatif I résume le processus du calcul.) Supposons que l'actif immobilisé de l'industrie demeure en production pendant 10 ans avant d'être retiré. On commence par la première année et, après déflation, on accumule les dépenses d'investissement se rapportant aux catégories de capital considérées pour une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs immobilisés de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif et on ajoute les achats d'actifs immobilisés au cours de la onzième année. On procède de la même façon pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs immobilisés à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Le stock net est égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée.

Les estimations trimestrielles de capital sont calculées d'après une interpolation linéaire des stocks annuels de capital. Ces estimations de stocks sont ajustées pour tenir compte des dépenses engagées au titre de la réduction de la pollution et ensuite combinées aux indices trimestriels désaisonnalisés de la production pour donner les coefficients de capital trimestriels pour l'ensemble de la période. L'indice de la production pour l'industrie des dérivés du pétrole et du charbon est l'indice de la production

(4) The indexes of industrial production used are those published in **Gross Domestic Product by Industry**, Catalogues 61-213, and 61-005, Statistics Canada.

(4) Les indices de la production industrielle utilisés ont été publiés dans **Produit intérieur brut par industrie**, n° 61-213 et 61-005 au catalogue, Statistique Canada.

index better reflects the performance of the industry in the light of significant price changes.(4)

These ratios are expressed in the Statistical Tables in constant 1971 dollars in order to show the degree of capital intensity in the various industries. The minimum capital-output ratio during this period indicates the historical capacity peak. When we divide the capital stocks series by the minimum capital-output ratio, we obtain a series of potential output.

As the final step in this procedure, actual data for individual production indexes are expressed as a ratio of the potential output series in percentage form to obtain the indexes of capacity utilization.

We summarize the procedure of measuring the capacity and operating rates in the following fashion:

Let  $K_t$  = fixed capital stocks at time  $t$ ,

let  $\frac{K_0}{P_0}$  = capacity capital-output ratio

where  $K_0$  = fixed capital in benchmark period(5)

and  $P_0$  = capacity output in the same period,

let  $P_t$  = actual output at time  $t$ ,

and  $CP_t$  = estimated capacity output at time  $t$ .

Then  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = percentage of capacity utilized at time  $t$ ; that is, the capacity utilization rate.

Of course, in subsequent periods, if a lower capital-output ratio occurs, it is adopted as the capacity ratio, and the entire series is adjusted accordingly.

This formula was used to calculate the manufacturing industry capacity utilization rates shown in the Statistical Tables. The indexes for durable, non-durable and total

brute au lieu de celui du produit intérieur brut qui est utilisé dans les autres industries. En vue d'importants changements des prix, on croit que l'indice de la production brute soit plus représentatif de la performance de cette industrie(4).

Dans les Tableaux statistiques, ces coefficients sont exprimés en dollars constants de 1971 de façon à indiquer le degré d'intensité de capital des différentes industries. Le coefficient de capital minimum au cours de cette période indique le sommet historique de la capacité. Lorsqu'on divise les séries des stocks de capital par le coefficient de capital minimum, on obtient une série de la production potentielle.

Enfin, les données réelles pour les indices de production individuels sont exprimées en tant que ratio des séries de la production potentielle en pourcentage pour obtenir les indices de l'utilisation de la capacité.

Nous pouvons résumer ainsi la marche à suivre pour la mesure des taux d'utilisation de la capacité et d'activité:

Soit  $K_t$  = stocks de capital au temps  $t$ ,

et soit  $\frac{K_0}{P_0}$  = coefficient de capital de la capacité

où  $K_0$  = capital fixe au cours de la période repère(5)

et  $P_0$  = production potentielle au cours de la même période,

soit  $P_t$  = production réelle au temps  $t$ ,

et  $CP_t$  = production potentielle prévue au temps  $t$ .

Alors  $K_t \div \frac{K_0}{P_0} = CP_t$ .

$\frac{P_t}{CP_t} \times 100$  = pourcentage de la capacité utilisée au temps  $t$ ; c'est-à-dire le taux d'utilisation de la capacité.

Bien entendu, lorsque l'on enregistre un coefficient de capital plus bas, au cours des périodes qui suivent, on le considère comme étant le ratio de capacité, et toute la série est ajustée en conséquence.

Cette formule a été utilisée pour calculer les taux de l'utilisation de la capacité des industries manufacturières présentés dans les Tableaux statistiques. Les indices ont été calculés par

(5) As noted previously, this benchmark period is the time when the minimum capital-output ratio occurred.

(5) Comme il a été mentionné auparavant, cette période repère est le moment où l'on a enregistré le plus bas coefficient capital-production.

TEXT TABLE I. Example: Assumed Service Life = 10 Years = L

manufacturing were derived by aggregation, using the same weights as the 1971 Gross Domestic Product.(6)

The statistics presented here are only statistical estimates and they are not operating ratios based on either engineering measures, such as productive machine hours, or survey results.

(6) For the period prior to 1971 the data are not available on a 1971 base. To obtain a continuous record on a 1971 base, the indexes on a 1961 base were mechanically rebased to 1971 by multiplying by 100.0 and dividing by the 1971 index value on a 1961 base. An adjustment has been made to the production indexes for Rubber and Plastics Products, and Miscellaneous Manufacturing, based on the annual Real Domestic Product Indexes, to capture the trend of the individual industries according to the 1970 Standard Industrial Classification, from 1961 to 1970.

agrégation tant pour l'ensemble des industries manufacturières que pour les industries des biens durables et non durables à partir des mêmes pondérations que celles pour du produit intérieur brut de 1971(6).

Ces chiffres représentent uniquement des approximations et ne sont pas des coefficients de fonctionnement basés sur des mesures industrielles, comme les heures de production des machines, ni des résultats d'une enquête.

(6) En ce qui concerne les années antérieures à 1971, les données ne sont pas disponibles sur la base 1971 = 100. Pour obtenir une continuité des données de ces années, les indices sur la base 1961 = 100 furent convertis arithmétiquement à l'année de référence 1971 en les multipliant par 100.0 et en divisant le produit obtenu par la valeur de l'indice de 1971 sur la base de 1961 = 100. On a ajusté les indices de production de l'industrie du caoutchouc et des produits en matière plastique, et des industries manufacturières diverses, basés sur l'indice annuel du produit intérieur réel de façon à connaître la tendance des industries selon la Classification des activités économiques de 1970, pour la période de 1961 à 1970.

Given the many conceptual and measurement problems surrounding the notion of capacity utilization, the utilization rates shown here are indicative of trends and cycles in the utilization of capital. The indicated level is only a statistical approximation and should be viewed as such. For example, a rate of 100% indicates a high level of capital utilization which is considered a peak for the period observed.

Étant donné qu'il existe plusieurs problèmes relatifs à la notion du taux d'utilisation, il conviendrait de noter que les taux d'utilisation publiés ne constituent pas des mesures exactes, mais des statistiques indiquant les tendances et les cycles d'utilisation du stock de capital fixe. Par exemple, un taux de 100% indique un haut niveau de l'utilisation de capital qui est considéré un sommet pendant la période observée.

	Miscellaneous manufacturing - Industries diverses	0.654	544.4

## HIGHLIGHTS

The utilization rates for the fourth quarter 1984 appearing in this publication correspond to those released on March 15, 1985 in the Statistics Canada Daily and CANSIM.

Capacity utilization in Canadian manufacturing industries remained relatively unchanged in the fourth quarter of 1984, edging up 0.3% to a level of 77.0% from 76.8% in the third quarter of 1984.

In the latest quarter, higher capacity utilization rates were posted in ten of the twenty industry groups. The most important gains registered in the fourth quarter were 6.4% in tobacco products, 5.7% in leather industries and 5.2% in furniture and fixtures. Of the ten industry groups whose rates decreased, there was only one significant decrease and that was in the machinery industry which was down by 5.3%. The rest of the decreases were less than 3.0%.

Utilization rates in durable manufacturing industries decreased by 0.7% in the fourth quarter of 1984 to 72.3% of capacity from 72.8% in the third quarter of 1984. In the non-durable sector, capacity utilization increased 1.0% to 81.8% from 81.0%.

As part of a continuous review of the quality of the capacity utilization rates it should be noted that the rates have been revised to reflect decreases in efficiency of older capital due to technical obsolescence and consolidations of operations by industries; in particular, Paper and Allied Industries and Petroleum and Coal Products. While these changes have affected the general level of the rates, they have not altered, to any significant degree, the trends reflected in the rates.

## FAITS SAILLANTS

Les taux d'utilisation publiés dans ce numéro du quatrième trimestre de 1984 correspondent à ceux parus dans le Quotidien de Statistique Canada du 15 mars 1985 et dans CANSIM.

L'utilisation de la capacité dans les industries manufacturières canadiennes a relativement peu varié au quatrième trimestre de 1984, passant de 76.8% qu'elle était au troisième trimestre à 77.0%, ce qui représente une hausse de 0.3%.

Au quatrième trimestre de 1984, dix des vingt branches d'activité ont connu une progression de leur capacité d'utilisation. Les avances les plus marquées ont été enregistrées dans les industries des tabacs (+ 6.4%), du cuir (+ 5.7%) et des meubles et accessoires (+ 5.2%). Parmi les dix branches d'activité où l'on a observé des diminutions, une seule accusait une baisse sensible, soit l'industrie des machines (- 5.3%). Les autres chutes n'atteignaient même pas 3.0%.

Les taux d'utilisation dans les industries manufacturières de biens durables ont diminué de 0.7%, reculant de 72.8% au troisième trimestre de 1984 à 72.3% au quatrième trimestre. Dans le secteur des biens non durables, l'utilisation de la capacité s'est accrue de 1.0%, faisant un bond de 81.0% à 81.8%.

Il convient de noter que, dans le cadre d'un examen permanent des taux d'utilisation de la capacité, ces derniers ont été révisés pour tenir compte de l'efficacité décroissante du capital ancien attribuable à l'obsolescence technique, et à la consolidation des opérations par les industries, particulièrement l'industrie du papier et activités annexes et la fabrication de produits du pétrole et du charbon. Ces corrections ont affecté le niveau général des taux, mais elles n'ont pas modifié de façon importante les tendances reflétées par ces taux.
